

DACxx6x-Q1 具有 2.5V、4PPM/°C 内部基准的汽车类双路 16 位、14 位、12 位低功耗、经缓冲的、电压输出 DAC

1 特性

- 适用于汽车电子 应用
- 具有符合 AEC-Q100 的下列结果：
 - 器件温度 1 级：-40°C 至 125°C 的环境运行温度范围
 - 器件人体模型 (HBM) 静电放电 (ESD) 分类等级 2
 - 器件组件充电模式 (CDM) ESD 分类等级 C4B
- 相对精度：
 - DAC756x (12 位)：0.3 最低有效位 (LSB) 最大积分非线性 (INL)
 - DAC816x (14 位)：1 LSB INL
 - DAC856x (16 位)：4 LSB INL
- 毛刺脉冲：0.1 nV-s
- 双向基准：输入或 2.5V 输出
 - 缺省情况下，输出被禁用
 - ±5mV 初始精度 (最大值)
 - 4ppm/°C 温度漂移 (典型值)
 - 10ppm/°C 温度漂移 (最大值)
 - 20mA 拉灌电流能力
- 加电复位至零量程或量程中点
- 低功耗：4mW (典型值, 5V AV_{DD}, 其中包括内部基准电流)
- 宽电源范围：2.7V 至 5.5V
- 带有施密特触发输入的 50MHz 串行外设接口 (SPI)
- LDAC 和 CLR 功能
- 支持轨到轨运行的输出缓冲器
- 封装：超薄小外形尺寸封装 (VSSOP)-10

2 应用

- 便携式仪表
- 可编程逻辑控制器 (PLC) 模拟输出模块
- 闭环伺服器控制
- 压控振荡器调谐
- 数据采集系统
- 可编程增益和偏移调整

3 说明

DAC756x-Q1、DAC816x-Q1 和 DAC856x-Q1 (DACxx6x-Q1) 器件分别为 12 位、14 位和 16 位低功耗、电压输出、双通道数模转换器 (DAC)。这些器件包括一个 2.5V, 4ppm/°C 内部基准, 从而提供了一个 2.5V 或 5V 的满量程输出电压范围。此内部基准有一个 ±5mV 的初始精度, 并且能够在 V_{REFIN}/V_{REFOUT} 引脚上提供或吸收高达 20mA 的电流。

这些器件是单片器件, 从而提供了出色的线性并大大降低了有害的代码至代码转换时的瞬态电压 (毛刺脉冲)。它们使用一个运行时钟速率高达 50MHz 的多用途 3 线制串口。此接口与标准 SPI™, QSPI™, Microwire, 以及数字信号处理器 (DSP) 接口兼容。DACxx62-Q1 器件配有一个上电复位电路, 此电路可确保在一个有效编码被写入此器件前, DAC 输出上电并保持零量程, 而 DACxx63-Q1 器件在量程中点上电。这些器件包含一个断电特性, 此特性可将 5V 电压时的流耗减少至 550nA (典型值)。此低功耗、内部基准和小封装尺寸使得这些器件非常适合于便携式、电池供电运行类设备。

与 DACxx63-Q1 器件一样, DACxx62-Q1 器件之间可互相插接并且功能兼容。整个系列均采用 10 引脚 VSSOP-10 (DGS) 封装。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
DAC7562-Q1	VSSOP (10)	3.00mm × 3.00mm
DAC7563-Q1		
DAC8162-Q1		
DAC8163-Q1		
DAC8562-Q1		
DAC8563-Q1		

(1) 如需了解所有可用封装, 请见数据表末尾的可订购产品附录。

Changes from Original (May 2013) to Revision A	Page
• 已更改 引脚配置和功能部分, ESD 额定值表, 特性 描述部分, 器件功能模式, 应用和实施部分, 电源相关建议部分, 布局部分, 器件和文档支持部分, 以及机械、封装和可订购信息部分	1
• 已发布 DAC8563-Q1、DAC8162-Q1、DAC8163-Q1、DAC7562-Q1 和 DAC7563-Q1 器件	1
• 已添加 the code-change total glitch amplitude parameter to the <i>Electrical Characteristics</i> table	6

5 Device Comparison Table

PART NUMBER	RESOLUTION	MAXIMUM RELATIVE ACCURACY (LSB)	MAXIMUM DIFFERENTIAL NONLINEARITY (LSB)	MAXIMUM REFERENCE DRIFT (ppm/°C)	RESET TO
DAC7562-Q1	12-bit	±0.75	±0.25	10	Zero
DAC7563-Q1					Mid-scale
DAC8162-Q1	14-bit	±3	±0.5	10	Zero
DAC8163-Q1					Mid-scale
DAC8562-Q1	16-bit	±12	±1	10	Zero
DAC8563-Q1					Mid-scale

6 Pin Configuration and Functions

PIN		DESCRIPTION
NAME	NO.	
AV _{DD}	9	Power-supply input, 2.7 V to 5.5 V
$\overline{\text{CLR}}$	5	Asynchronous clear input. The $\overline{\text{CLR}}$ input is falling-edge sensitive. When $\overline{\text{CLR}}$ is activated, zero scale (DACxx62-Q1) or mid-scale (DACxx63-Q1) is loaded to all input and DAC registers. This sets the DAC output voltages accordingly. The part exits clear code mode on the 24 th falling edge of the next write to the part. If $\overline{\text{CLR}}$ is activated during a write sequence, the write is aborted.
D _{IN}	8	Serial data input. Data are clocked into the 24-bit input shift register on each falling edge of the serial clock input. Schmitt-trigger logic input
GND	3	Ground reference point for all circuitry on the device
$\overline{\text{LDAC}}$	4	In <i>synchronous</i> mode, data are updated with the falling edge of the 24 th SCLK cycle, which follows a falling edge of SYNC. For such <i>synchronous</i> updates, the $\overline{\text{LDAC}}$ pin is not required, and it must be connected to GND permanently or asserted and held low before sending commands to the device. In <i>asynchronous</i> mode, the $\overline{\text{LDAC}}$ pin is used as a negative edge-triggered timing signal for simultaneous DAC updates. Multiple single-channel commands can be written in order to set different channel buffers to desired values and then make a falling edge on $\overline{\text{LDAC}}$ pin to simultaneously update the DAC output registers.
SCLK	7	Serial clock input. Data can be transferred at rates up to 50 MHz. Schmitt-trigger logic input
$\overline{\text{SYNC}}$	6	Level-triggered control input (active-low). This input is the frame synchronization signal for the input data. When $\overline{\text{SYNC}}$ goes low, it enables the input shift register, and data are sampled on subsequent falling clock edges. The DAC output updates following the 24 th clock falling edge. If $\overline{\text{SYNC}}$ is taken high before the 23 rd clock edge, the rising edge of $\overline{\text{SYNC}}$ acts as an interrupt, and the write sequence is ignored by the DAC756x-Q1, DAC816x-Q1, DAC856x-Q1. Schmitt-trigger logic input
V _{OUTA}	1	Analog output voltage from DAC-A
V _{OUTB}	2	Analog output voltage from DAC-B
V _{REFIN} /V _{REFOUT}	10	Bidirectional voltage reference pin. If internal reference is used, 2.5-V output.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted).⁽¹⁾

	MIN	MAX	UNIT
V_{DD} to GND	-0.3	6	V
\overline{CLR} , D_{IN} , \overline{LDAC} , $SCLK$ and \overline{SYNC} input voltage to GND	-0.3	$V_{DD} + 0.3$	V
$V_{OUT[A, B]}$ to GND	-0.3	$V_{DD} + 0.3$	V
V_{REFIN}/V_{REFOUT} to GND	-0.3	$V_{DD} + 0.3$	V
Operating temperature	-40	125	°C
Junction temperature, T_{Jmax}		150	°C
Storage temperature, T_{stg}	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT	
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V	
	Charged-device model (CDM), per AEC Q100-011	All pins		±500
		Corner pins (1, 5, 6, and 10)		±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
POWER SUPPLY					
Supply voltage	V_{DD} to GND	2.7		5.5	V
DIGITAL INPUTS					
Digital input voltage	\overline{CLR} , D_{IN} , \overline{LDAC} , $SCLK$ and \overline{SYNC}	0		V_{DD}	V
REFERENCE INPUT					
V_{REFIN} Reference input voltage		0		V_{DD}	V
TEMPERATURE RANGE					
T_A Operating ambient temperature		-40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DACxx6x-Q1	UNIT
		DGS (VSSOP)	
		10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	173.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	48.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	79.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.7	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	68.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Electrical Characteristics

At $V_{DD} = 2.7\text{ V}$ to 5.5 V and $T_A = -40^\circ\text{C}$ to 125°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE⁽¹⁾						
DAC856x-Q1	Resolution		16			Bits
	Relative accuracy	Using line passing through codes 512 and 65,024		±4	±12	LSB
	Differential nonlinearity	16-bit monotonic		±0.2	±1	LSB
DAC816x-Q1	Resolution		14			Bits
	Relative accuracy	Using line passing through codes 128 and 16,256		±1	±3	LSB
	Differential nonlinearity	14-bit monotonic		±0.1	±0.5	LSB
DAC756x-Q1	Resolution		12			Bits
	Relative accuracy	Using line passing through codes 32 and 4,064		±0.3	±0.75	LSB
	Differential nonlinearity	12-bit monotonic		±0.05	±0.25	LSB
Offset error		Extrapolated from two-point line ⁽¹⁾ , unloaded		±1	±4	mV
Offset error drift				±2		$\mu\text{V}/^\circ\text{C}$
Full-scale error		DAC register loaded with all 1s		±0.03	±0.2	% FSR
Zero-code error		DAC register loaded with all 0s		1	4	mV
Zero-code error drift				±2		$\mu\text{V}/^\circ\text{C}$
Gain error		Extrapolated from two-point line ⁽¹⁾ , unloaded		±0.01	±0.15	% FSR
Gain temperature coefficient				±1		ppm FSR/ $^\circ\text{C}$
OUTPUT CHARACTERISTICS⁽²⁾						
Output voltage range			0		V_{DD}	V
Output voltage settling time ⁽³⁾	DACs unloaded			7		μs
	$R_L = 1\text{ M}\Omega$			10		
Slew rate		Measured between 20% - 80% of a full-scale transition		0.75		V/ μs
Capacitive load stability	$R_L = \infty$			1		nF
	$R_L = 2\text{ k}\Omega$			3		
Code-change glitch impulse		1-LSB change around major carry		0.1		nV-s
Digital feedthrough		SCLK toggling, $\overline{\text{SYNC}}$ high		0.1		nV-s
Power-on glitch impulse		$R_L = 2\text{ k}\Omega$, $C_L = 470\text{ pF}$, $V_{DD} = 5.5\text{ V}$		40		mV
Code-change total glitch amplitude		1-LSB change around major carry. Includes glitch impulse and digital feedthrough. $R_L = 2\text{ k}\Omega$, $C_L = 470\text{ pF}$, $V_{DD} = 5.5\text{ V}$		3		mV
Channel-to-channel DC crosstalk	Full-scale swing on adjacent channel, External reference			5		μV
	Full-scale swing on adjacent channel, Internal reference			15		
DC output impedance		At mid-scale input		5		Ω
Short-circuit current		DAC outputs at full-scale, DAC outputs shorted to GND		40		mA
Power-up time, including settling time		Coming out of power-down mode		50		μs
AC PERFORMANCE⁽²⁾						
DAC output noise density		$T_A = 25^\circ\text{C}$, at mid-scale input, $f_{OUT} = 1\text{ kHz}$		90		$\text{nV}/\sqrt{\text{Hz}}$
DAC output noise		$T_A = 25^\circ\text{C}$, at mid-scale input, 0.1 Hz to 10 Hz		2.6		μV_{PP}

(1) 16-bit: codes 512 and 65,024; 14-bit: codes 128 and 16,256; 12-bit: codes 32 and 4,064

(2) Specified by design or characterization

(3) Transition time between $\frac{1}{4}$ scale and $\frac{3}{4}$ scale including settling to within $\pm 0.024\%$ FSR

Electrical Characteristics (接下页)

 At $AV_{DD} = 2.7\text{ V to }5.5\text{ V}$ and $T_A = -40^\circ\text{C to }125^\circ\text{C}$ (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LOGIC INPUTS⁽²⁾						
Input pin Leakage current			-1	±0.1	1	µA
Logic input LOW voltage V_{INL}			0		0.8	V
Logic input HIGH voltage V_{INH}			$0.7 \times AV_{DD}$		AV_{DD}	V
Pin capacitance					3	pF
REFERENCE						
External reference current		External $V_{REF} = 2.5\text{ V}$ (when internal reference is disabled), all channels active using gain = 1		15		µA
Reference input impedance		Internal reference disabled, gain = 1		170		kΩ
		Internal reference disabled, gain = 2		85		
REFERENCE OUTPUT						
Output voltage		$T_A = 25^\circ\text{C}$	2.495	2.5	2.505	V
Initial accuracy		$T_A = 25^\circ\text{C}$	-5	±0.1	5	mV
Output voltage temperature drift				4	10	ppm/°C
Output voltage noise		$f = 0.1\text{ Hz to }10\text{ Hz}$		12		µV _{PP}
Output voltage noise density (high-frequency noise)		$T_A = 25^\circ\text{C}, f = 1\text{ kHz}, C_L = 0\text{ }\mu\text{F}$		250		nV/√Hz
		$T_A = 25^\circ\text{C}, f = 1\text{ MHz}, C_L = 0\text{ }\mu\text{F}$		30		
		$T_A = 25^\circ\text{C}, f = 1\text{ MHz}, C_L = 4.7\text{ }\mu\text{F}$		10		
Load regulation, sourcing ⁽⁴⁾		$T_A = 25^\circ\text{C}$		20		µV/mA
Load regulation, sinking ⁽⁴⁾		$T_A = 25^\circ\text{C}$		185		µV/mA
Output current load capability ⁽²⁾				±20		mA
Line regulation		$T_A = 25^\circ\text{C}$		50		µV/V
Long-term stability and drift (aging) ⁽⁴⁾		$T_A = 25^\circ\text{C}, \text{time} = 0\text{ to }1900\text{ hours}$		100		ppm
Thermal hysteresis ⁽⁴⁾		First cycle		200		ppm
		Additional cycles		50		
POWER REQUIREMENTS⁽⁵⁾						
I_{DD}	$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$	Normal mode, internal reference off		0.25	0.5	mA
		Normal mode, internal reference on		0.9	1.6	
		Power-down modes ⁽⁶⁾		0.55	2	µA
		Power-down modes ⁽⁷⁾		0.55	4	
	$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$	Normal mode, internal reference off		0.2	0.4	mA
		Normal mode, internal reference on		0.73	1.4	
		Power-down modes ⁽⁶⁾		0.35	2	µA
		Power-down modes ⁽⁷⁾		0.35	3	
Power dissipation	$AV_{DD} = 3.6\text{ V to }5.5\text{ V}$	Normal mode, internal reference off		0.9	2.75	mW
		Normal mode, internal reference on		3.2	8.8	
		Power-down modes ⁽⁶⁾		2	11	µW
		Power-down modes ⁽⁷⁾		2	22	
	$AV_{DD} = 2.7\text{ V to }3.6\text{ V}$	Normal mode, internal reference off		0.54	1.44	mW
		Normal mode, internal reference on		1.97	5	
		Power-down modes ⁽⁶⁾		0.95	7.2	µW
		Power-down modes ⁽⁷⁾		0.95	10.8	

 (4) See the [Application Information](#) section of this data sheet.

 (5) Input code = mid-scale, no load, $V_{INH} = AV_{DD}$, and $V_{INL} = \text{GND}$

 (6) Temperature range $-40^\circ\text{C to }105^\circ\text{C}$

 (7) Temperature range $-40^\circ\text{C to }125^\circ\text{C}$

7.6 Timing Requirements⁽¹⁾⁽²⁾

At $V_{DD} = 2.7\text{ V}$ to 5.5 V and over -40°C to 125°C (unless otherwise noted). See [图 1](#).

		MIN	NOM	MAX	UNIT
$f_{(SCLK)}$	Serial clock frequency			50	MHz
t_1	SCLK falling edge to \overline{SYNC} falling edge (for successful write operation)	10			ns
t_2	SCLK cycle time	20			ns
t_3	\overline{SYNC} rising edge to 23 rd SCLK falling edge (for successful \overline{SYNC} interrupt)	13			ns
t_4	Minimum \overline{SYNC} HIGH time	80			ns
t_5	\overline{SYNC} to SCLK falling edge setup time	13			ns
t_6	SCLK LOW time	8			ns
t_7	SCLK HIGH time	8			ns
t_8	SCLK falling edge to \overline{LDAC} rising edge	10			ns
t_9	Data setup time	6			ns
t_{10}	Data hold time	5			ns
t_{11}	SCLK falling edge to \overline{LDAC} falling edge for asynchronous LDAC update mode	5			ns
t_{12}	\overline{LDAC} pulse duration, LOW time	10			ns
t_{13}	\overline{CLR} pulse duration, LOW time	80			ns
t_{14}	\overline{CLR} falling edge to start of V_{OUT} transition		100		ns

(1) All input signals are specified with $t_R = t_F = 3\text{ ns}$ (10% to 90% of V_{DD}) and timed from a voltage level of $(V_{INL} + V_{INH}) / 2$.

(2) See the *Serial Write Operation* timing diagram ([图 1](#)).

(1) Asynchronous \overline{LDAC} update mode. For more information, see the [LDAC Functionality](#) section.

(2) Synchronous \overline{LDAC} update mode; \overline{LDAC} remains low. For more information, see the [LDAC Functionality](#) section.

8 Detailed Description

8.1 Overview

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices are low-power, voltage-output, dual-channel, 12-, 14-, and 16-bit digital-to-analog converters (DACs), respectively. These devices include a 2.5-V, 4-ppm/°C internal reference, giving a full-scale output voltage range of 2.5 V or 5 V. The internal reference has an initial accuracy of ±5 mV and can source or sink up to 20 mA at the V_{REFIN}/V_{REFOUT} pin.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Digital-to-Analog Converter (DAC)

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 architecture consists of two string DACs, each followed by an output buffer amplifier. The devices include an internal 2.5-V reference with 4-ppm/°C temperature drift performance. 图 88 shows a principal block diagram of the DAC architecture.

图 88. DAC Architecture

The input coding to the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices is straight binary, so the ideal output voltage is given by 公式 1:

$$V_{OUT} = \left(\frac{D_{IN}}{2^n} \right) \times V_{REF} \times \text{Gain} \quad (1)$$

where:

n = resolution in bits; either 12 (DAC756x-Q1), 14 (DAC816x-Q1) or 16 (DAC856x-Q1)

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register. D_{IN} ranges from 0 to 2ⁿ - 1.
V_{REF} = DAC reference voltage; either V_{REFOUT} from the internal 2.5-V reference or V_{REFIN} from an external reference.

Gain = 1 by default when internal reference is disabled (using external reference), and gain = 2 by default when using internal reference. Gain can also be manually set to either 1 or 2 using the gain register. See the [Gain Function](#) section for more information.

Feature Description (接下页)

8.3.1.1 Resistor String

The resistor string section is shown in 图 89. It is simply a string of resistors, each of value R . The code loaded into the DAC register determines at which node on the string the voltage is tapped off to be fed into the output amplifier by closing one of the switches connecting the string to the amplifier. The resistor string architecture results in monotonicity. The R_{DIVIDER} switch is controlled by the gain registers (see the [Gain Function](#) section). Because the output amplifier has a gain of 2, R_{DIVIDER} is not shorted when the DAC-n gain is set to 1 (default if internal reference is disabled), and is shorted when the DAC-n gain is set to 2 (default if internal reference is enabled).

图 89. Resistor String

8.3.1.2 Output Amplifier

The output buffer amplifier is capable of generating rail-to-rail voltages on its output, giving a maximum output range of 0 V to AV_{DD} . It is capable of driving a load of 2 k Ω in parallel with 3 nF to GND. The typical slew rate is 0.75 V/ μ s, with a typical full-scale settling time of 14 μ s as shown in 图 31, 图 32, 图 75 and 图 76.

Feature Description (接下页)

8.3.2 Internal Reference

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices include a 2.5-V internal reference that is disabled by default. The internal reference is externally available at the V_{REFIN}/V_{REFOUT} pin. The internal reference output voltage is 2.5 V and can sink and source up to 20 mA.

A minimum 150-nF capacitor is recommended between the reference output and GND for noise filtering.

The internal reference of the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices is a bipolar transistor-based precision band-gap voltage reference. 图 90 shows the basic band-gap topology. Transistors Q_1 and Q_2 are biased such that the current density of Q_1 is greater than that of Q_2 . The difference of the two base-emitter voltages ($V_{BE1} - V_{BE2}$) has a positive temperature coefficient and is forced across resistor R_1 . This voltage is amplified and added to the base-emitter voltage of Q_2 , which has a negative temperature coefficient. The resulting output voltage is virtually independent of temperature. The short-circuit current is limited by design to approximately 100 mA.

图 90. Band-Gap Reference Simplified Schematic

8.3.3 Power-On Reset

8.3.3.1 Power-On Reset to Zero-Scale

The DAC7562-Q1, DAC8162-Q1, and DAC8562-Q1 devices contain a power-on-reset circuit that controls the output voltage during power up. All device registers are reset as shown in 表 4. At power up, all DAC registers are filled with zeros and the output voltages of all DAC channels are set to zero volts. Each DAC channel remains that way until a valid load command is written to it. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. No device pin should be brought high before applying power to the device. The internal reference is disabled by default and remains that way until a valid reference-change command is executed.

8.3.3.2 Power-On Reset to Mid-Scale

The DAC7563-Q1, DAC8163-Q1, and DAC8563-Q1 devices contain a power-on reset circuit that controls the output voltage during power up. At power up, all DAC registers are reset to mid-scale code and the output voltages of all DAC channels are set to $V_{REFIN} / 2$ V. Each DAC channel remains that way until a valid load command is written to it. The power-on reset is useful in applications where it is important to know the state of the output of each DAC while the device is in the process of powering up. No device pin should be brought high before applying power to the device. The internal reference is powered off or down by default and remains that way until a valid reference-change command is executed. If using an external reference, it is acceptable to power on the V_{REFIN} pin either at the same time as or after applying AV_{DD} .

表 4. DACxx62-Q1 and DACxx63-Q1 Power-On Reset Values

REGISTER	DEFAULT SETTING	
DAC and input registers	DACxx62-Q1	Zero-scale
	DACxx63-Q1	Mid-scale
LDAC registers	LDAC pin enabled for both channels	
Power-down registers	DACs powered up	
Internal reference register	Internal reference disabled	
Gain registers	Gain = 1 for both channels	

8.3.3.3 Power-On Reset (POR) Levels

When the device powers up, a POR circuit sets the device in default mode as shown in 表 4. The POR circuit requires specific AV_{DD} levels, as indicated in 图 91, to ensure discharging of internal capacitors and to reset the device on power up. In order to ensure a power-on reset, AV_{DD} must be below 0.7 V for at least 1 ms. When AV_{DD} drops below 2.2 V but remains above 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions. In this case, TI recommends a power-on reset. When AV_{DD} remains above 2.2 V, a power-on reset does not occur.

图 91. Relevant Voltage Levels for POR Circuit

8.4 Device Functional Modes

8.4.1 Power-Down Modes

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices have two separate sets of power-down commands. One set is for the DAC channels and the other set is for the internal reference. The internal reference is forced to a powered-down state while both DAC channels are powered down, and is only enabled if any DAC channel is also in the normal mode of operation. For more information on the internal reference control, see the [Internal Reference Enable Register](#) section.

8.4.1.1 DAC Power-Down Commands

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 DACs use four modes of operation. These modes are accessed by setting the serial interface command bits to 100. Once the command bits are set correctly, the four different power-down modes are software programmable by setting bits DB5 and DB4 in the shift register. [表 5](#) and [表 6](#) show the different power-down options. For more information on how to set the DAC operating mode see [表 17](#).

表 5. DAC-n Operating Modes

DB5	DB4	DAC MODES OF OPERATION
0	0	Selected DACs power up (normal mode, default)
0	1	Selected DACs power down, output 1 kΩ to GND
1	0	Selected DACs power down, output 100 kΩ to GND
1	1	Selected DACs power down, output Hi-Z to GND

表 6. DAC-n Selection for Operating Modes

DAC-B (DB1), DAC-A (DB0)	OPERATING MODE
0	DAC-n does not change operating mode
1	DAC-n operating mode set to value on PD1 and PD0

It is possible to write to the DAC register or buffer of the DAC channel that is powered down. When the DAC channel is then powered up, it powers up to this new value.

The advantage of the available power-down modes is that the output impedance of the device is known while it is in power-down mode. As described in [表 5](#), there are three different power-down options. V_{OUT} can be connected internally to GND through a 1-kΩ resistor, a 100-kΩ resistor, or open-circuited (Hi-Z). The DAC power-down circuitry is shown in [图 92](#).

图 92. Output Stage

8.4.2 Gain Function

The gain register controls the GAIN setting in the DAC transfer function:

$$V_{OUT} = \left(\frac{D_{IN}}{2^n} \right) \times V_{REF} \times \text{Gain} \quad (2)$$

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices have a gain register for each channel. The gain for each channel, in [公式 2](#), is either 1 or 2. This gain is automatically set to 2 when using the internal reference, and is automatically set to 1 when the internal reference is disabled (default). However, each channel can have either gain by setting the registers appropriately. The gain registers are accessible by setting the serial interface command bits to 000, address bits to 010, and using DB1 for DAC-B and DB0 for DAC-A. See [表 7](#) and [表 17](#) for the full command structure. The gain registers are automatically reset to provide either gain of 1 or 2 when the internal reference is powered off or on, respectively. After the reference is powered off or on, the gain register is again accessible to change the gain.

表 7. DAC-n Selection for Gain Register Command

DB1, DB0	VALUE	GAIN
DB0	0	DAC-A uses gain = 2 (default with internal reference)
	1	DAC-A uses gain = 1 (default with external reference)
DB1	0	DAC-B uses gain = 2 (default with internal reference)
	1	DAC-B uses gain = 1 (default with external reference)

8.4.3 Software Reset Function

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices contain a software reset feature. The software reset function is accessed by setting the serial interface command bits to 101. The software reset command contains two reset modes which are software-programmable by setting bit DB0 in the shift register. [表 8](#) and [表 17](#) show the available software reset commands.

表 8. Software Reset

DB0	REGISTERS RESET TO DEFAULT VALUES
0	DAC registers Input registers
1	DAC registers Input registers LDAC registers Power-down registers Internal reference register Gain registers

8.4.4 Internal Reference Enable Register

The internal reference in the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices is disabled by default for debugging, evaluation purposes, or when using an external reference. The internal reference can be powered up and powered down by setting the serial interface command bits to 111 and configuring DB0 (see 表 9). The internal reference is forced to a powered down state while both DAC channels are powered down, and can only be enabled if any DAC channel is in normal mode of operation. During the time that the internal reference is disabled, the DAC functions normally using an external reference. At this point, the internal reference is disconnected from the V_{REFIN}/V_{REFOUT} pin (Hi-Z output).

表 9. Internal Reference

DB0	INTERNAL REFERENCE CONFIGURATION
0	Disable internal reference and reset DACs to gain = 1
1	Enable internal reference and reset DACs to gain = 2

8.4.4.1 Enabling Internal Reference

To enable the internal reference, refer to the command structure in 表 17. When performing a power cycle to reset the device, the internal reference is switched off (default mode). In the default mode, the internal reference is powered down until a valid write sequence powers up the internal reference. However, the internal reference is forced to a disabled state while both DAC channels are powered down, and remains disabled until either DAC channel is returned to the normal mode of operation. See [DAC Power-Down Commands](#) for more information on DAC channel modes of operation.

8.4.4.2 Disabling Internal Reference

To disable the internal reference, refer to the command structure in 表 17. When performing a power cycle to reset the device, the internal reference is disabled (default mode).

8.4.5 CLR Functionality

The edge-triggered $\overline{\text{CLR}}$ pin can be used to set the input and DAC registers immediately according to 表 10. When the $\overline{\text{CLR}}$ pin receives a falling edge signal the clear mode is activated and changes the DAC output voltages accordingly. The device exits clear mode on the 24th falling edge of the next write to the device. If the $\overline{\text{CLR}}$ pin receives a falling edge signal during a write sequence in normal operation, the clear mode is activated and changes the input and DAC registers immediately according to 表 10.

表 10. Clear Mode Reset Values

DEVICE	DAC OUTPUT ENTERING CLEAR MODE
DAC8562-Q1, DAC8162-Q1, DAC7562-Q1	Zero-scale
DAC8563-Q1, DAC8163-Q1, DAC7563-Q1	Mid-scale

8.4.6 LDAC Functionality

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices offer both a software and hardware simultaneous update and control function. The DAC double-buffered architecture has been designed so that new data can be entered for each DAC without disturbing the analog outputs.

DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 data updates can be performed either in *synchronous* or in *asynchronous* mode.

In *asynchronous* mode, the $\overline{\text{LDAC}}$ pin is used as a negative edge-triggered timing signal for simultaneous DAC updates. Multiple single-channel writes can be done in order to set different channel buffers to desired values and then make a falling edge on $\overline{\text{LDAC}}$ pin to simultaneously update the DAC output registers. Data buffers of all channels must be loaded with desired data before an $\overline{\text{LDAC}}$ falling edge. After a high-to-low $\overline{\text{LDAC}}$ transition, all DACs are simultaneously updated with the last contents of the corresponding data buffers. If the content of a data buffer is not changed, the corresponding DAC output remains unchanged after the $\overline{\text{LDAC}}$ pin is triggered. $\overline{\text{LDAC}}$ must be returned high before the next serial command is initiated.

In *synchronous* mode, data are updated with the falling edge of the 24th SCLK cycle, which follows a falling edge of SYNC. For such *synchronous* updates, the $\overline{\text{LDAC}}$ pin is not required, and it must be connected to GND permanently or asserted and held low before sending commands to the device.

Alternatively, all DAC outputs can be updated simultaneously using the built-in software function of LDAC. The LDAC register offers additional flexibility and control by allowing the selection of which DAC channel(s) should be updated simultaneously when the $\overline{\text{LDAC}}$ pin is being brought low. The LDAC register is loaded with a 2-bit word (DB1 and DB0) using command bits C2, C1, and C0 (see 表 17). The default value for each bit, and therefore for each DAC channel, is zero. If the LDAC register bit is set to 1, it overrides the $\overline{\text{LDAC}}$ pin (the $\overline{\text{LDAC}}$ pin is internally tied low for that particular DAC channel) and this DAC channel updates synchronously after the falling edge of the 24th SCLK cycle. However, if the LDAC register bit is set to 0, the DAC channel is controlled by the $\overline{\text{LDAC}}$ pin.

The combination of software and hardware simultaneous update functions is particularly useful in applications when updating a DAC channel, while keeping the other channel unaffected; see 表 11 and 表 17 for more information.

表 11. DAC-n Selection for LDAC Register Command

DB1, DB0	VALUE	$\overline{\text{LDAC}}$ PIN FUNCTIONALITY
DB0	0	DAC-A uses $\overline{\text{LDAC}}$ pin
	1	DAC-A operates in synchronous mode
DB1	0	DAC-B uses $\overline{\text{LDAC}}$ pin
	1	DAC-B operates in synchronous mode

8.5 Programming

The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices have a three-wire serial interface ($\overline{\text{SYNC}}$, SCLK, and D_{IN} ; see the table) compatible with SPI, QSPI, and Microwire interface standards, as well as most DSPs. See the Serial Write Operation timing diagram (图 1) for an example of a typical write sequence.

The DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 input shift register is 24 bits wide, consisting of two *don't care* bits (DB23 to DB22), three command bits (DB21 to DB19), three address bits (DB18 to DB16), and 16 data bits (DB15 to DB0). All 24 bits of data are loaded into the DAC under the control of the serial clock input, SCLK. DB23 (MSB) is the first bit that is loaded into the DAC shift register. DB23 is followed by the rest of the 24-bit word pattern, left-aligned. This configuration means that the first 24 bits of data are latched into the shift register, and any further clocking of data is ignored.

The write sequence begins by bringing the $\overline{\text{SYNC}}$ line low. Data from the D_{IN} line are clocked into the 24-bit shift register on each falling edge of SCLK. The serial clock frequency can be as high as 50 MHz, making the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices compatible with high-speed DSPs. On the 24th falling edge of the serial clock, the last data bit is clocked into the shift register and the shift register locks. Further clocking does not change the shift register data.

After receiving the 24th falling clock edge, the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices decode the three command bits, three address bits and 16 data bits to perform the required function, without waiting for a $\overline{\text{SYNC}}$ rising edge. After the 24th falling edge of SCLK is received, the $\overline{\text{SYNC}}$ line may be kept low or brought high. In either case, the minimum delay time from the 24th falling SCLK edge to the next falling $\overline{\text{SYNC}}$ edge must be met in order to begin the next cycle properly; see the Serial Write Operation timing diagram (图 1).

A rising edge of $\overline{\text{SYNC}}$ before the 24-bit sequence is complete resets the SPI interface; no data transfer occurs. A new write sequence starts at the next falling edge of $\overline{\text{SYNC}}$. To assure the lowest power consumption of the device, care should be taken that the levels are as close to each rail as possible.

8.5.1 $\overline{\text{SYNC}}$ Interrupt

In a normal write sequence, the $\overline{\text{SYNC}}$ line stays low for at least 24 falling edges of SCLK and the addressed DAC register updates on the 24th falling edge. However, if $\overline{\text{SYNC}}$ is brought high before the 23rd falling edge, it acts as an interrupt to the write sequence; the shift register resets and the write sequence is discarded. Neither an update of the data buffer contents, DAC register contents, nor a change in the operating mode occurs (as shown in 图 93).

图 93. $\overline{\text{SYNC}}$ Interrupt Facility

Programming (接下页)

8.5.2 DAC Register Configuration

When the DAC registers are being written to, the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices receive all 24 bits of data, ignore DB23 and DB22, and decode the next three bits (DB21 to DB19) in order to determine the DAC operating or control mode (see 表 12). Bits DB18 to DB16 are used to address the DAC channels (see 表 13).

表 12. Commands for the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 Devices

C2 (DB21)	C1 (DB20)	C0 (DB19)	COMMAND

A2 (DB18)	A1 (DB17)	A0 (DB16)	CHANNEL (n)
0	0	0	DAC-A
0	0	1	DAC-B
0	1	0	Gain (only use with command 000)
0	1	1	Reserved
1	0	0	Reserved
1	0	1	Reserved
1	1	0	Reserved
1	1	1	DAC-A and DAC-B

When writing to the DAC input registers the next 16, 14, or 12 bits of data that follow are decoded by the DAC to determine the equivalent analog output (see 表 14 through 表 16). The data format is straight binary, with all 0s corresponding to 0-V output and all 1s corresponding to full-scale output. For all documentation purposes, the data format and representation used here is a true 16-bit pattern (that is, FFFFh data word for full scale) that the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices require.

表 14. DAC856x-Q1 Data Input Register Format

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 DAC Internal Reference

The internal reference of the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices does not require an external load capacitor for stability because it is stable without any capacitive load. However, for improved noise performance, an external load capacitor of 150 nF or larger connected to the V_{REFIN}/V_{REFOUT} output is recommended. 图 94 shows the typical connections required for operation of the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 internal reference. A supply bypass capacitor at the AV_{DD} input is also recommended.

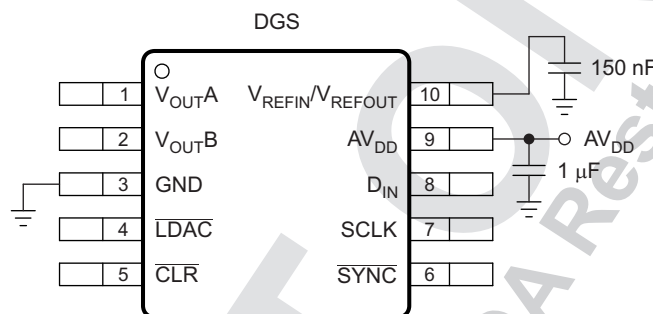

图 94. Typical Connection for Operating the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 Internal Reference

9.1.1.1 Supply Voltage

The internal reference features an extremely low dropout voltage. It can be operated with a supply of only 5 mV above the reference output voltage in an unloaded condition. For loaded conditions, see the [Load Regulation](#) section. The stability of the internal reference with variations in supply voltage (line regulation, dc PSRR) is also exceptional. Within the specified supply voltage range of 2.7 V to 5.5 V, the variation at V_{REFIN}/V_{REFOUT} is typically 50 $\mu\text{V}/\text{V}$; see 图 7.

9.1.1.2 Temperature Drift

The internal reference is designed to exhibit minimal drift error, defined as the change in reference output voltage over varying temperature. The drift is calculated using the box method described by 公式 3:

$$\text{Drift Error} = \left(\frac{V_{REF_MAX} - V_{REF_MIN}}{V_{REF} \times T_{RANGE}} \right) \times 10^6 \text{ (ppm}/^\circ\text{C)} \quad (3)$$

where:

V_{REF_MAX} = maximum reference voltage observed within temperature range T_{RANGE} .

V_{REF_MIN} = minimum reference voltage observed within temperature range T_{RANGE} .

V_{REF} = 2.5 V, target value for reference output voltage.

T_{RANGE} = the characterized range from -40°C to 125°C (165 $^\circ\text{C}$ range)

The internal reference features an exceptional typical drift coefficient of 4 ppm/ $^\circ\text{C}$ from -40°C to 125°C . Characterizing a large number of units, a maximum drift coefficient of 10 ppm/ $^\circ\text{C}$ is observed. Temperature drift results are summarized in 图 3.

Application Information (接下页)

9.1.1.3 Noise Performance

Typical 0.1-Hz to 10-Hz voltage noise and noise spectral density performance are listed in the [Electrical Characteristics](#). Additional filtering can be used to improve output noise levels, although care should be taken to ensure the output impedance does not degrade the ac performance. The output noise spectrum at the V_{REFIN}/V_{REFOUT} pin, both unloaded and with an external 4.7- μ F load capacitor, is shown in [图 6](#). Internal reference noise impacts the DAC output noise when the internal reference is used.

9.1.1.4 Load Regulation

Load regulation is defined as the change in reference output voltage as a result of changes in load current. The load regulation of the internal reference is measured using force and sense contacts as shown in [图 95](#). The force and sense lines reduce the impact of contact and trace resistance, resulting in accurate measurement of the load regulation contributed solely by the internal reference. Measurement results are shown in [图 4](#). Force and sense lines should be used for applications that require improved load regulation.

图 95. Accurate Load Regulation of the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 Internal Reference

9.1.1.4.1 Long-Term Stability

Long-term stability or aging refers to the change of the output voltage of a reference over a period of months or years. This effect lessens as time progresses. The typical drift value for the internal reference is listed in the [Electrical Characteristics](#) and measurement results are shown in [图 5](#). This parameter is characterized by powering up multiple devices and measuring them at regular intervals.

9.1.1.5 Thermal Hysteresis

Thermal hysteresis for a reference is defined as the change in output voltage after operating the device at 25°C, cycling the device through the operating temperature range, and returning to 25°C. Hysteresis is expressed by [公式 4](#):

$$V_{HYST} = \left[\frac{V_{REF_PRE} - V_{REF_POST}}{V_{REF_NOM}} \right] \times 10^6 (\text{ppm}/^\circ\text{C}) \quad (4)$$

where:

V_{HYST} = thermal hysteresis.

V_{REF_PRE} = output voltage measured at 25°C pre-temperature cycling.

V_{REF_POST} = output voltage measured after the device cycles through the temperature range of -40°C to 125°C, and returns to 25°C.

V_{REF_NOM} = 2.5 V, target value for reference output voltage.

9.1.2 DAC Noise Performance

Output noise spectral density at the V_{OUT-n} pin versus frequency is depicted in [图 45](#) and [图 46](#) for full-scale, mid-scale, and zero-scale input codes. The typical noise density for mid-scale code is 90 nV/ $\sqrt{\text{Hz}}$ at 1 kHz. High-frequency noise can be improved by filtering the reference noise. Integrated output noise between 0.1 Hz and 10 Hz is close to 2.5 μ V_{PP} (mid-scale), as shown in [图 47](#).

Typical Applications (接下页)

$$V_{OUT} = \frac{R_G}{2} \times \left(\frac{V_{DAC} - V_{REF}}{R_{SET}} \right) \quad (5)$$

When configured for current mode, the XTR300 routes the internal output of its current copy circuitry to the SET pin. This provides feedback for the internal OPA driver based on 1 / 10th of the output current, resulting in a voltage-to-current transfer function. Generating bipolar current outputs from the single-ended DAC output voltage, V_{DAC} , requires the application of an offset to the XTR300 SET pin. Connect the R_{SET} resistor from the SET pin to V_{REF} to apply the offset and obtain the transfer function shown in [公式 6](#).

$$I_{OUT} = 10 \times \left(\frac{V_{DAC} - V_{REF}}{R_{SET}} \right) \quad (6)$$

The desired output ranges for V_{DAC} and V_{REF} voltages determine the R_{SET} and R_G resistor values, calculated using [公式 7](#) and [公式 8](#). The system design requires a V_{DAC} voltage range of 0.04 V to 4.96 V in order to operate the DAC8563-Q1 in the specified linear output range from codes 512 to 65 024.

$$R_{SET} = 10 \times \left(\frac{V_{DAC} - V_{REF}}{I_{OUT}} \right) = 10 \times \left(\frac{4.96 \text{ V} - 2.5 \text{ V}}{0.024 \text{ A}} \right) = 1025 \ \Omega \quad (7)$$

$$R_G = \frac{2 \times V_{OUT_MAX} \times R_{SET}}{V_{DAC} - V_{REF}} = \frac{2 \times 10 \text{ V} \times 1020 \ \Omega}{4.96 \text{ V} - 2.5 \text{ V}} = 8292 \ \Omega \quad (8)$$

I_{MON} and I_{A_OUT} accomplish load monitoring. The sizing of R_{IMON} and R_{IA} determine the monitoring output voltage across the resistors. Size the resistors according to [公式 9](#) and [公式 10](#) and the expected output load current I_{DRV} .

$$R_{IMON} = \frac{10 \times V_{IMON}}{I_{DRV}} \quad (9)$$

$$R_{IA} = \frac{10 \times V_{IA}}{I_{IA}} \quad (10)$$

For more detailed information about the design procedure of this circuit and how to isolate it, see *Two-Channel Source/Sink Combined Voltage & Current Output, Isolated, EMC/EMI Tested Reference Design (TIDU434)*.

Typical Applications (接下页)

9.2.1.3 Application Curves

图 97 shows the transfer function for the bipolar ± 10 V voltage range. This design also supports output voltage ranges of 0–5 V, 0–10 V and ± 5 V. 图 98 shows the transfer function for the unipolar 0–24 mA current range. This design also supports output current ranges of ± 24 mA and 4 mA–20 mA.

Typical Applications (接下页)

9.2.2 Up to ±15-V Bipolar Output Using the DAC8562-Q1

The DAC8562-Q1 is designed to be operate from a single power supply providing a maximum output range of AV_{DD} volts. However, the DAC can be placed in the configuration shown in 图 99 in order to be designed into bipolar systems. Depending on the ratio of the resistor values, the output of the circuit can range anywhere from ± 5 V to ± 15 V. The design example below shows that the DAC is configured to have its internal reference enabled and the DAC8562-Q1 internal gain set to 2, however, an external 2.5-V reference could also be used (with DAC8562-Q1 internal gain set to 2).

图 99. Bipolar Output Range Circuit Using DAC8562-Q1

The transfer function shown in Equation 5 can be used to calculate the output voltage as a function of the DAC code, reference voltage and resistor ratio:

$$V_{OUT} = G \times V_{REFOUT} \left(2 \times \frac{D_{IN}}{65,536} - 1 \right) \quad (11)$$

where:

D_{IN} = decimal equivalent of the binary code that is loaded to the DAC register, ranging from 0 to 65,535 for DAC8562-Q1 (16 bit).

V_{REFOUT} = reference output voltage with the internal reference enabled from the DAC V_{REFIN}/V_{REFOUT} pin

G = ratio of the resistors

An example configuration to generate a ± 10 -V output range is shown below in Equation 6 with $G = 4$ and $V_{REFOUT} = 2.5$ V:

$$V_{OUT} = 20 \times \frac{D_{IN}}{65,536} - 10 \text{ V} \quad (12)$$

In this example, the range is set to ± 10 V by using a resistor ratio of four, V_{REFOUT} of 2.5 V, and DAC8562-Q1 internal gain of 2. The resistor sizes must be selected keeping in mind the current sink or source capability of the DAC8562-Q1 internal reference. Using larger resistor values, for example, $R = 10$ k Ω or larger, is recommended. The op amp is selectable depending on the requirements of the system.

The DAC8562EVM and DAC7562EVM boards have the option to evaluate the bipolar output application by installing the components on the pre-placed footprints. For more information see either the [DAC8562EVM](#) or [DAC7562EVM](#) product folder.

9.3 System Examples

9.3.1 MSP430 Microprocessor Interfacing

Figure 100 shows a serial interface between the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device and a typical MSP430 USI port such as the one found on the MSP430F2013. The port is configured in SPI master mode by setting bits 3, 5, 6, and 7 in USICTL0. The USI counter interrupt is set in USICTL1 to provide an efficient means of SPI communication with minimal software overhead. The serial clock polarity, source, and speed are controlled by settings in the USI clock control register (USICKCTL). The SYNC signal is derived from a bit-programmable pin on port 1; in this case, port line P1.4 is used. When data are to be transmitted to the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device, P1.4 is taken low. The USI transmits data in 8-bit bytes; thus, only eight falling clock edges occur in the transmit cycle. To load data to the DAC, P1.4 is left low after the first eight bits are transmitted; then, a second write cycle is initiated to transmit the second byte of data. P1.4 is taken high following the completion of the third write cycle.

NOTE: Additional pins omitted for clarity.

Figure 100. DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 Device to MSP430 Interface

9.3.2 TMS320 McBSP Microprocessor Interfacing

Figure 101 shows an interface between the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device and any TMS320 series DSP from Texas Instruments with a multi-channel buffered serial port (McBSP). Serial data are shifted out on the rising edge of the serial clock and are clocked into the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device on the falling edge of the SCLK signal.

NOTE: Additional pins omitted for clarity.

Figure 101. DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 Device to TMS320 McBSP Interface

9.3.3 OMAP-L1x Processor Interfacing

Figure 102 shows a serial interface between the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device and the OMAP-L138 processor. The transmit clock CLKx0 of the L138 drives SCLK of the DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 device, and the data transmit (Dx0) output drives the serial data line of the DAC. The SYNC signal is derived from the frame sync transmit (FSx0) line, similar to the TMS320 interface.

NOTE: Additional pins omitted for clarity.

Figure 102. DAC756x-Q1, DAC816x-Q1, or DAC856x-Q1 Device to OMAP-L1x Processor

10 Power Supply Recommendations

These devices can operate within the specified supply voltage range of 2.7 V to 5.5 V. The power applied to AV_{DD} should be well-regulated and low-noise. In order to further minimize noise from the power supplies, a strong recommendation is to include a pair of 100-pF and 1-nF capacitors and a 0.1- μ F to 1- μ F bypass capacitor. The current consumption of the AV_{DD} pin, the short-circuit current limit, and the load current for these devices are listed in the [Electrical Characteristics](#) table. Choose the power supplies for these devices to meet the aforementioned current requirements.

11 Layout

11.1 Layout Guidelines

A precision analog component requires careful layout, adequate bypassing, and clean, well-regulated power supplies. The DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices offer single-supply operation, and are often used in close proximity with digital logic, microcontrollers, microprocessors, and digital signal processors. The more digital logic present in the design and the higher the switching speed, the more difficult it is to keep digital noise from appearing at the output. As a result of the single ground pin of the DAC756x-Q1, DAC816x-Q1, and DAC856x-Q1 devices, all return currents (including digital and analog return currents for the DAC) must flow through a single point. Ideally, GND would be connected directly to an analog ground plane. This plane would be separate from the ground connection for the digital components until they were connected at the power-entry point of the system. The power applied to AV_{DD} should be well-regulated and low noise. Switching power supplies and dc-dc converters often have high-frequency glitches or spikes riding on the output voltage. In addition, digital components can create similar high-frequency spikes as their internal logic switches states. This noise can easily couple into the DAC output voltage through various paths between the power connections and analog output. As with the GND connection, AV_{DD} should be connected to a power-supply plane or trace that is separate from the connection for digital logic until they are connected at the power-entry point. In addition, a pair of 100-pF to 1-nF capacitors and a 0.1- μ F to 1- μ F bypass capacitor are strongly recommended. In some situations, additional bypassing may be required, such as a 100- μ F electrolytic capacitor or even a pi filter made up of inductors and capacitors – all designed essentially to provide low-pass filtering for the supply and remove the high-frequency noise.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

DGS0010A

PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

4221984/A 05/2015

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187, variation BA.

EXAMPLE BOARD LAYOUT

DGS0010A

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
SCALE:10X

SOLDER MASK DETAILS
NOT TO SCALE

4221984/A 05/2015

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DGS0010A

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:10X

4221984/A 05/2015

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

重要声明和免责声明

TI 提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保或其他要求。这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 TI 的销售条款 (<https://www.ti.com.cn/zh-cn/legal/termsofsale.html>) 或 [ti.com.cn](https://www.ti.com.cn) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。
