

LMH6702QML-SP 1.7GHz、超低失真、宽带运算放大器

1 特性

- $V_S = \pm 5V$, $T_A = 25^\circ C$, $A_V = +2V/V$, $R_L = 100\Omega$, $V_{OUT} = 2V_{PP}$ (典型值, 除非另有说明)
- 具有辐射保证
 - 高剂量率 300krad(Si)
 - 在 300krad(Si) 条件下无 ELDRS
- -3dB 带宽 ($V_{OUT} = 0.2V_{PP}$): 720MHz
- 低噪声: 1.83nV/√Hz
- 快速稳定至 0.1% 的时间: 13.4ns
- 快速压摆率: 3100V/μs
- 电源电流: 12.5mA
- 输出电流: 80mA
- 低互调失真 (75MHz): -67dBc
- 经改进可替代 CLC409 和 CLC449

2 应用

- Flash A/D 驱动器
- D/A 跨阻缓冲器
- 宽动态范围中频放大器
- 雷达和通信接收器
- 线路驱动器
- 高分辨率视频

3 说明

LMH6702QML-SP 是一款超宽带、直流耦合、单片运算放大器, 专为需要出色信号保真度的宽动态范围系统而设计。得益于采用 TI 的电流反馈架构, LMH6702QML-SP 可以出色的速度提供单位增益稳定性, 无需外部补偿。

LMH6702QML-SP 具有 720MHz 带宽 ($A_V = 2V/V$, $V_O = 2V_{PP}$)、60MHz 范围内的 10 位失真水平 ($R_L = 100\Omega$)、1.83nV/√Hz 输入基准噪声和 12.5mA 电源电流, 是适用于高速 Flash 模数 (A/D) 和数模 (D/A) 转换器的出色驱动器或缓冲器。

LMH6702QML-SP 对于需要宽带放大器提供出色信号纯度的宽动态范围系统 (例如雷达和通信接收器) 颇有益处。低输入基准噪声以及低谐波和互调失真使得该器件非常适合高速应用。

LMH6702QML-SP 采用 TI 的 VIP10 互补双极工艺和 TI 成熟的电流反馈架构构建而成。

封装信息

器件型号	封装 ⁽¹⁾	封装尺寸 ⁽²⁾

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{Jmax} (maximum junction temperature), θ_{JA} (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is $P_{Dmax} = (T_{Jmax} - T_A) / \theta_{JA}$ or the number given in the *Absolute Maximum Ratings*, whichever is lower.
- (3) Human body model, 1.5k Ω in series with 100pF.

5.2 Recommended Operating Conditions

	VALUE
Supply voltage (V_{CC})	$\pm 5V_{DC}$ to $\pm 6V_{DC}$
Gain	± 1 to ± 10
Ambient operating temperature (T_A)	-55°C to $+125^{\circ}\text{C}$

5.3 Quality Conformance Inspection

MIL-STD-883, Method 5005, Group A

5.4 Electrical Characteristics: DC Parameters

The following conditions apply (unless otherwise specified)^{(1) (2)}:

$R_L = 100\Omega$, $V_{CC} = \pm 5V_{DC}$, $A_V = +2$ feedback resistor (R_F) = 250 Ω , gain resistor (R_G) = 250 Ω

PARAMETER		TEST CONDITIONS	NOTES	MIN	MAX	UNIT	SUB-GROUPS
I_{BN}	Input bias current, noninverting			- 15	15	μA	1, 2
				- 21	21	μA	3
I_{BI}	Input bias current, inverting			- 30	30	μA	1, 2
				- 34	34	μA	3
V_{IO}	Input offset voltage			- 4.5	4.5	mV	1, 3
				- 6.0	6.0	mV	2
I_{CC}	Supply current, no load	$R_L = \infty$			15	mA	1, 2, 3
PSSR	Power supply rejection ratio	$-V_{CC} = -4.5V$ to $-5.0V$, $+V_{CC} = 4.5V$ to $5.0V$		45		dB	1, 2, 3

- (1) The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.
- (2) Pre- and post-irradiation limits are identical to those listed under the dc parameter tables. Post-irradiation testing is conducted at room temperature, 25°C, only. Testing is performed as specified in MIL-STD-883 Test Method 1019 Condition A. The ELDRS-Free part is also tested per Test Method 1019 Conditions D.

5.5 Electrical Characteristics: AC Parameters

The following conditions apply (unless otherwise specified)^{(1) (2)}:

$R_L = 100\Omega$, $V_{CC} = \pm 5V_{DC}$, $A_V = +2$ feedback resistor (R_F) = 250 Ω , gain resistor (R_G) = 250 Ω

PARAMETER		TEST CONDITIONS	NOTES	MIN	MAX	UNIT	SUB-GROUPS
HD ₃	3rd harmonic distortion	2V _{PP} at 20MHz			- 62	dBc	4
GFPL	Gain flatness peaking	0.1MHz to 75MHz, $V_O < 0.5V_{PP}$			0.4	dB	4
GFPH	Gain flatness peaking	> 75MHz, $V_O < 0.5V_{PP}$			2.0	dB	4
GFRH	Gain flatness rolloff	75MHz to 125MHz, $V_O < 0.5V_{PP}$			0.2	dB	4
HD ₂	2nd harmonic distortion	2V _{PP} at 20MHz			- 52	dBc	4

- (1) The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.
- (2) These parameters are not post irradiation tested.

5.6 Electrical Characteristics: Drift Values Parameters

The following conditions apply (unless otherwise specified)⁽¹⁾:

$R_L = 100\Omega$, $V_{CC} = \pm 5V_{DC}$, $A_V = +2$ feedback resistor (R_F) = 250 Ω , gain resistor (R_G) = 250 Ω

Delta not required on B level product. Delta required for S-level product at Group B5 only, or as specified on the internal processing instruction (IPI).

PARAMETER		TEST CONDITIONS	PACKAGE	MIN	MAX	UNIT	SUB-GROUPS
I_{BN}	Input bias current noninverting		NAB	- 0.3	0.3	μA	1
			NAC	- 0.75	0.75		
I_{BI}	Input bias current inverting			- 3.0	3.0	μA	1
V_{IO}	Input offset voltage		NAB	- 0.3	0.3	mV	1
			NAC	- 1.0	1.0		

- (1) The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.

6 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

6.1 Application Information

6.1.1 Feedback Resistor

图 6-1. Recommended Noninverting Gain Circuit

图 6-2. Recommended Inverting Gain Circuit

The LMH6702 achieves excellent pulse and distortion performance by using current feedback topology. The loop gain for a current-feedback op amp, and thus the frequency response, is predominantly set by the feedback-resistor value. The LMH6702 is optimized for use with a 237Ω feedback resistor. Using lower values can lead to excessive ringing in the pulse response while a higher value limits the bandwidth. Application Note OA-13 [SNOA366](#) discusses this configuration in detail along with the occasions where a different R_F can be advantageous.

6.1.2 Harmonic Distortion

The LMH6702 has been optimized for exceptionally low harmonic distortion while driving very demanding resistive or capacitive loads. Generally, when used as the input amplifier to very high-speed flash ADCs, the distortions introduced by the converter dominate over the low LMH6702 distortions. Capacitor C_{SS} , shown across the supplies in [图 6-1](#) and [图 6-2](#), is critical to achieving the lowest 2nd harmonic distortion. For absolute minimum distortion levels, keep the supply decoupling currents (ground connections to C_{POS} , and C_{NEG} in [图 6-1](#)

and 图 6-2) separate from the ground connections to sensitive input circuitry (such as R_G , R_T , and R_{IN} ground connections). Splitting the ground plane in this manner, and separately routing the high frequency current spikes on the decoupling caps back to the power supply (similar to a *star connection* layout technique) provides minimum coupling back to the input circuitry and results in best harmonic distortion response (especially 2nd-order distortion).

If this layout technique has not been observed on a particular application board, the supply decoupling capacitors can adversely affect HD2 performance by increasing the coupling phenomenon already mentioned. 图 6-3 shows actual HD2 data on a board where the ground plane is shared between the supply decoupling capacitors and the rest of the circuit. After these capacitors are removed, the HD2 distortion levels reduce significantly, especially between 10MHz to 20MHz, as shown in 图 6-3.

图 6-3. Decoupling Current Adverse Effect on a Board With Shared Ground Plane

At these extremely low distortion levels, the high-frequency behavior of decoupling capacitors themselves can be significant. In general, lower-value decoupling capacitors tend to have higher resonance frequencies, making lower-value decoupling capacitors more effective for higher-frequency regions. A particular application board that has been laid out correctly with ground returns split to minimize coupling benefits the most by having low-value and higher-value capacitors paralleled to take advantage of the effective bandwidth of each, and extend the low-distortion frequency range.

6.1.3 Capacitive Load Drive

图 6-4 shows a typical application using the LMH6702 to drive an ADC.

图 6-4. Input Amplifier to ADC

The series resistor, R_S , between the amplifier output and the ADC input is critical to achieving best system performance. This load capacitance, if applied directly to the output pin, can quickly lead to unacceptable levels of ringing in the pulse response. The plot of R_S and Settling Time vs C_L in the *Typical Characteristics* is an

excellent starting point for selecting R_S . The value derived in that plot minimizes the step settling time into a fixed discrete capacitive load with the output driving a very light resistive load ($1k\Omega$). Sensitivity to capacitive loading is greatly reduced after the output is loaded more heavily. Therefore, for cases where the output is heavily loaded, R_S value can be reduced. The exact value can best be determined experimentally for these cases.

In applications where the LMH6702 is replacing the CLC409, take care when the device is lightly loaded and some capacitance is present at the output. As a result of the much higher frequency response of the LMH6702 compared to the CLC409, increased susceptibility to low value output capacitance (parasitic or inherent to the board layout or otherwise being part of the output load) is possible. As previously mentioned, this susceptibility is most noticeable when the LMH6702 resistive load is light. Parasitic capacitance can be minimized by careful layout. Addition of an output snubber R-C network also helps by increasing the high-frequency resistive loading.

Referring back to [图 6-4](#), consider several additional constraints in driving the capacitive input of an ADC. There is an option to increase R_S , band-limiting at the ADC input for either noise or Nyquist band-limiting purposes. However, increasing R_S too much can induce an unacceptably large input glitch due to switching transients coupling through from the convert signal. Also, C_{IN} is often a voltage-dependent capacitance. This input impedance nonlinearity induces distortion terms that increase as R_S is increased. Therefore, attempt only slight adjustments up or down from the recommended R_S value in optimizing system performance.

6.1.4 DC Accuracy and Noise

Example below shows the output offset computation equation for the noninverting configuration using the typical bias current and offset specifications for $A_V = +2$:

$$\text{Output Offset: } V_O = (\pm I_{BN} \times R_{IN} \pm V_{IO}) (1 + R_F/R_G) \pm I_{BI} \times R_F$$

Where R_{IN} is the equivalent input impedance on the noninverting input.

Example computation for $A_V = +2$, $R_F = 237\Omega$, $R_{IN} = 25\Omega$:

$$V_O = (\pm 6 \mu A \times 25\Omega \pm 1mV) (1 + 237/237) \pm 8 \mu A \times 237 = \pm 4.20mV$$

A good design, however, includes a worst-case calculation using minimum and maximum numbers in the data sheet tables to provide worst-case operation.

Further improvement in the output offset voltage and drift is possible using composite amplifiers. The two input bias currents are physically unrelated in both magnitude and polarity for the current feedback topology. Therefore, to cancel the effects by matching the source impedance for the two inputs (as is commonly done for matched input bias current devices) is not possible.

The total output noise is computed in a similar fashion to the output offset voltage. Using the input noise voltage and the two input noise currents, the output noise is developed through the same gain equations for each term but combined as the square root of the sum of squared contributing elements. See the [OA-12 Noise Analysis for Comlinear Amplifiers application report](#) for a full discussion of noise calculations for current-feedback amplifiers.

6.2 Layout

6.2.1 Layout Guidelines

Generally, a good high frequency layout keeps power supply and ground traces away from the inverting input and output pins. Parasitic capacitance on these nodes to ground cause frequency-response peaking and possible circuit oscillations (see the [OA-15 Frequent Faux Pas in Applying Wideband Current Feedback Amplifiers application report](#) for more information). Texas Instruments suggests the following evaluation boards as a guide for high-frequency layout and as an aid in device testing and characterization:

DEVICE	PACKAGE	EVALUATION BOARD PART NUMBER
LMH6702QMLMF	SOT-23-5	CLC730216
LMH6702QMLMA	Plastic SOIC	CLC730227

7 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

7.1 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 [通知](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

7.2 支持资源

TI E2E™ [中文支持论坛](#) 是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [使用条款](#)。

7.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

7.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

7.5 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NAB0008A

CONTROLLING DIMENSION IS INCH
VALUES IN [] ARE MILLIMETERS

J08A (Rev M)

PACKAGE OUTLINE

NAC0010A

CFP - 2.33mm max height

CERAMIC FLATPACK

4215196/D 08/2022

NOTES:

- All controlling linear dimensions are in inches. Dimensions in brackets are in millimeters. Any dimension in brackets or parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- For solder thickness and composition, see the "Lead Finish Composition/Thickness" link in the packaging section of the Texas Instruments website
- Lead 1 identification shall be:
 - A notch or other mark within this area
 - A tab on lead 1, either side
- No JEDEC registration as of December 2021
