

## 高电压、大电流运算放大器

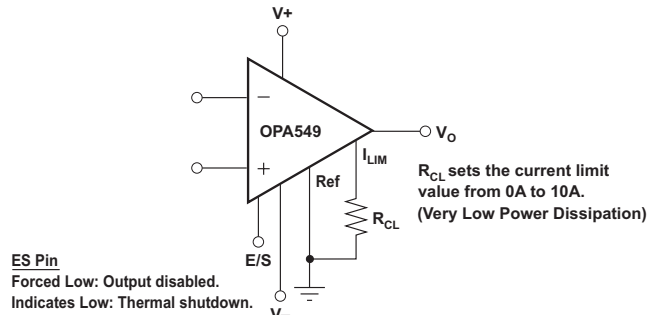

查询样品: **OPA549-HiRel**

### 特性

- 高输出电流:
  - **8A** 持续电流
  - **10A** 峰值电流
- 宽电源电压范围:
  - 单电源: **8 V 至 60V**
  - 双电源: **±4V 至 ±30V**
- 宽输出电压摆幅
- 受到完全保护:
  - 过热保护
  - 可调电流
- 输出禁用控制
- 热关断指示器
- 高转换率: **9V/μs**
- 控制基准引脚
- **11** 引线功率封装

支持国防、航空航天、和医疗应用

- 受控基线
- 一个组装/测试场所
- 一个制造场所
- 军用温度范围 **(-55°C/125°C)** 内可用<sup>(1)</sup>
- 延长的产品生命周期
- 延长的产品变更通知
- 产品可追溯性

### 应用范围

- 阀门、致动器驱动器
- 同步器、伺服器驱动器
- 电源
- 测试设备
- 转换器激励
- 音频功率放大器

(1) 可提供额外温度范围-请与厂家联系

### 说明

OPA549 是一款低成本、高压大电流运算放大器，此放大器非常适合于驱动多种负载。这个激光微调的单片集成电路提供出色的低电平信号精度和高输出电压和电流。

为了实现设计灵活性，OPA549 可由单电源或者双电源供电。输入共模的扩展范围低于负电源。

OPA549 在过热情况下和电流过载时受到内部保护。此外，OPA549 提供一个精准的、用户可选择的限流。与其它使用一个与输出电流路径串联的功率电阻器的设计不同，OPA549 间接的感应负载。这样允许使用一个电阻器或者电势计在 0A 至 10A 间对限流进行调节，或者使用一个电压输出或电流输出模数转换器 (DAC) 来进行数控。

使能/状态 (E/S) 引脚提供了两个功能。对于它的监控可被用来确定器件是否处于热关断状态，它还可以被强制为低电平以禁用输出级并且有效地断开负载。

OPA549 采用 11 引线功率封装。它的铜质拉环可以很容易地安装到散热片上，这样可实现出色的散热性能。额定运行温度范围为 -55°C 至 + 125°C。

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**ORDERING INFORMATION<sup>(1)</sup>**

T <sub>CASE</sub>	PACKAGE	ORDERABLE PART NUMBER	TOP-SIDE MARKING
-55°C to 125°C	KVC	OPA549MKVC	OPA549M

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).

Connect both pins 1 and 2 to output.  
 Connect both pins 5 and 7 to V-.  
 Connect both pins 10 and 11 to V+.

## APPLICATION INFORMATION

Figure 3 shows the OPA549 connected as a basic noninverting amplifier. The OPA549 can be used in virtually any operational amplifier configuration.

Power-supply terminals should be bypassed with low series impedance capacitors. The technique shown in Figure 3, using a ceramic and tantalum type in parallel, is recommended. Power-supply wiring should have low series impedance.

Be sure to connect both output pins (pins 1 and 2).

NOTES: (1)  $I_{LIM}$  connected to Ref gives the maximum current limit, 10A (peak). (2) Connect capacitors directly to package power-supply pins.

**Figure 3. Basic Circuit Connections**

### Power Supplies

The OPA549 operates from single (8-V to 60-V) or dual ( $\pm 4$ -V to  $\pm 30$ -V) supplies with excellent performance. Most behavior remains unchanged throughout the full operating voltage range. Parameters that vary significantly with operating voltage are shown in the Typical Characteristics. Some applications do not require equal positive and negative output voltage swing. Power-supply voltages do not need to be equal. The OPA549 can operate with as little as 8 V between the supplies and with up to 60 V between the supplies. For example, the positive supply could be set to 55 V with the negative supply at  $-5$  V. Be sure to connect both  $V-$  pins (pins 5 and 7) to the negative power supply, and both  $V+$  pins (pins 10 and 11) to the positive power supply. Package tab is internally connected to  $V-$ ; however, do not use the tab to conduct current.

### Control Reference (Ref) Pin

The OPA549 features a reference (Ref) pin to which the  $I_{LIM}$  and the E/S pin are referred. Ref simply provides a reference point accessible to the user that can be set to  $V-$ , ground, or any reference of the user's choice. Ref cannot be set below the negative supply or above  $(V+) - 8$  V. If the minimum  $V_S$  is used, Ref must be set at  $V-$ .

### Adjustable Current Limit

The OPA549's accurate, user-defined current limit can be set from 0 A to 10 A by controlling the input to the  $I_{LIM}$  pin. Unlike other designs, which use a power resistor in series with the output current path, the OPA549 senses the load indirectly. This allows the current limit to be set with a 0- $\mu$ A to 633- $\mu$ A control signal. In contrast, other designs require a limiting resistor to handle the full output current (up to 10 A in this case).

Although the design of the OPA549 allows output currents up to 10 A, it is not recommended that the device be operated continuously at that level. The highest rated continuous current capability is 8 A. Continuously running the OPA549 at output currents greater than 8 A will degrade long-term reliability.

Operation of the OPA549 with current limit less than 1 A results in reduced current limit accuracy. Applications requiring lower output current may be better suited to the OPA547 or OPA548.

### Resistor-Controlled Current Limit

See [Figure 4\(a\)](#) for a simplified schematic of the internal circuitry used to set the current limit. Leaving the  $I_{LIM}$  pin open programs the output current to zero, while connecting  $I_{LIM}$  directly to Ref programs the maximum output current limit, typically 10 A.

With the OPA549, the simplest method for adjusting the current limit uses a resistor or potentiometer connected between the  $I_{LIM}$  pin and Ref according to [Equation 1](#):

$$R_{CL} = \frac{75kV}{I_{LIM}} - 7.5k\Omega \quad (1)$$

Refer to [Figure 4](#) for commonly used values.

### Digitally-Controlled Current Limit

The low-level control signal (0  $\mu$ A to 633  $\mu$ A) also allows the current limit to be digitally controlled by setting either a current ( $I_{SET}$ ) or voltage ( $V_{SET}$ ). The output current  $I_{LIM}$  can be adjusted by varying  $I_{SET}$  according to [Equation 2](#):

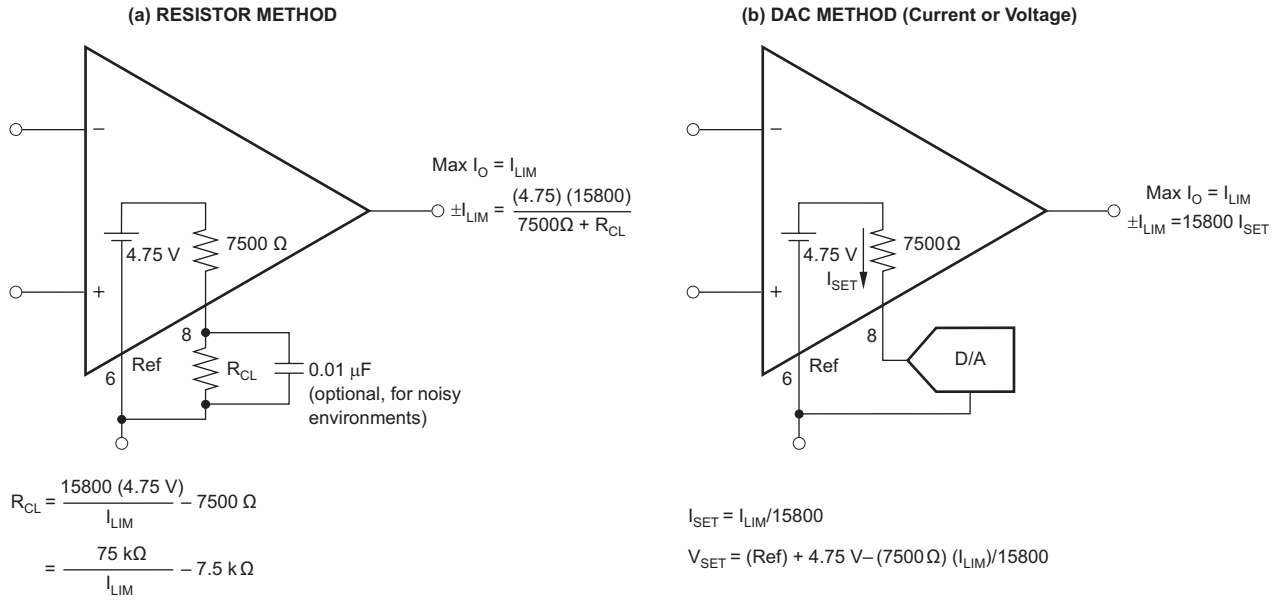

$$I_{SET} = \frac{I_{LIM}}{15800} \quad (2)$$

[Figure 4\(b\)](#) demonstrates a circuit configuration implementing this feature.

The output current  $I_{LIM}$  can be adjusted by varying  $V_{SET}$  according to [Equation 3](#):

$$V_{SET} = (\text{Ref}) + 4.75V - \frac{(7500W)(I_{LIM})}{15800} \quad (3)$$

demonstrates a circuit configuration implementing this feature.

OPA549 CURRENT LIMIT: 0 A to 10 A

DESIRED CURRENT LIMIT	RESISTOR <sup>(1)</sup> (R <sub>CL</sub> )	CURRENT (I <sub>SET</sub> )	VOLTAGE (V <sub>SET</sub> )
0A <sup>(2)</sup>	I <sub>LIM</sub> Open	0 μA	(Ref) + 4.75 V
2.5 A	22.6 kΩ	158 μA	(Ref) + 3.56 V
3 A	17.4 kΩ	190 μA	(Ref) + 3.33 V
4 A	11.3 kΩ	253 μA	(Ref) + 2.85 V
5 A	7.5 kΩ	316 μA	(Ref) + 2.38 V
6 A	4.99 kΩ	380 μA	(Ref) + 1.90 V
7 A	3.24 kΩ	443 μA	(Ref) + 1.43 V
8 A	1.87 kΩ	506 μA	(Ref) + 0.95 V
9 A	845 Ω	570 μA	(Ref) + 0.48 V
10 A	I <sub>LIM</sub> Connected to Ref	633 μA	(Ref)

NOTES: (1) Resistors are nearest standard 1% values. (2) Offset in the current limit circuitry may introduce approximately ±0.25 A variation at low current limit values.

Figure 4. Adjustable Current Limit

### Enable/Status (E/S) Pin

The enable/status pin provides two unique functions: 1) output disable by forcing the pin low, and 2) thermal shutdown indication by monitoring the voltage level at the pin. Either or both of these functions can be utilized in an application. For normal operation (output enabled), the E/S pin can be left open or driven high (at least 2.4 V above Ref). A small value capacitor connected between the E/S pin and C<sub>REF</sub> may be required for noisy applications.

### Output Disable

To disable the output, the E/S pin is pulled to a logic low (no greater than 0.8 V above Ref). Typically the output is shut down in 1 μs. To return the output to an enabled state, the E/S pin should be disconnected (open) or pulled to at least 2.4 V above Ref. It should be noted that driving the E/S pin high (output enabled) does not defeat internal thermal shutdown; however, it does prevent the user from monitoring the thermal shutdown status. Figure 5 shows an example implementing this function.

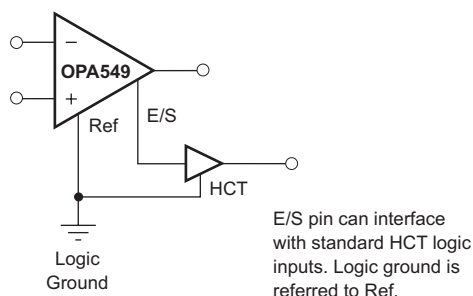

This function not only conserves power during idle periods (quiescent current drops to approximately 6 mA) but also allows multiplexing in multi-channel applications. See [Figure 14](#) for two OPA549s in a switched amplifier configuration. The on/off state of the two amplifiers is controlled by the voltage on the E/S pin. Under these conditions, the disabled device will behave like a 750-pF load. Slewing faster than 3 V/ $\mu$ s will cause leakage current to rapidly increase in devices that are disabled, and will contribute additional load. At high temperature (125°C), the slewing threshold drops to approximately 2 V/ $\mu$ s. Input signals must be limited to avoid excessive slewing in multiplexed applications.

**Figure 5. Output Disable**

### Thermal Shutdown Status

The OPA549 has thermal shutdown circuitry that protects the amplifier from damage. The thermal protection circuitry disables the output when the junction temperature reaches approximately 160°C and allows the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is automatically re-enabled. Depending on load and signal conditions, the thermal protection circuit may cycle on and off. The E/S pin can be monitored to determine if the device is in shutdown. During normal operation, the voltage on the E/S pin is typically 3.5V above Ref. Once shutdown has occurred, this voltage drops to approximately 200 mV above Ref. [Figure 6](#) shows an example implementing this function.

**Figure 6. Thermal Shutdown Status**

External logic circuitry or an LED can be used to indicate if the output has been thermally shutdown, see [Figure 12](#).

### Output Disable and Thermal Shutdown Status

As mentioned earlier, the OPA549's output can be disabled and the disable status can be monitored simultaneously. [Figure 7](#) provides an example of interfacing to the E/S pin.

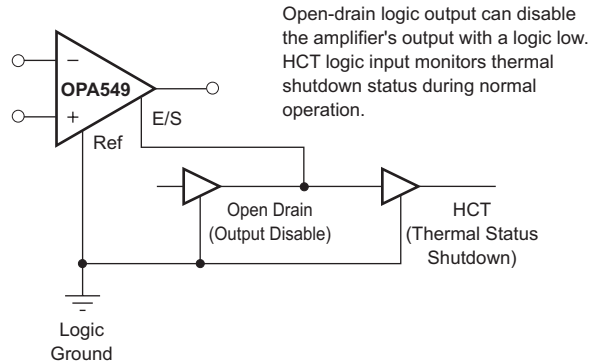

Figure 7. Output Disable and Thermal Shutdown Status

**Safe Operating Area**

Stress on the output transistors is determined both by the output current and by the output voltage across the conducting output transistor,  $V_S - V_O$ . The power dissipated by the output transistor is equal to the product of the output current and the voltage across the conducting transistor,  $V_S - V_O$ . The safe operating area (SOA curve, Figure 8) shows the permissible range of voltage and current.

Figure 8. Safe Operating Area

The safe output current decreases as  $V_S - V_O$  increases. Output short circuits are a very demanding case for SOA. A short circuit to ground forces the full power-supply voltage ( $V_+$  or  $V_-$ ) across the conducting transistor. Increasing the case temperature reduces the safe output current that can be tolerated without activating the thermal shutdown circuit of the OPA549. For further insight on SOA, consult Application Bulletin (SBOA022).

**Power Dissipation**

Power dissipation depends on power supply, signal, and load conditions. For dc signals, power dissipation is equal to the product of output current times the voltage across the conducting output transistor. Power dissipation can be minimized by using the lowest possible power-supply voltage necessary to assure the required output voltage swing.

For resistive loads, the maximum power dissipation occurs at a dc output voltage of one-half the power-supply voltage. Dissipation with ac signals is lower. Application Bulletin (SBOA022) explains how to calculate or measure power dissipation with unusual signals and loads.

## Thermal Protection

Power dissipated in the OPA549 will cause the junction temperature to rise. Internal thermal shutdown circuitry shuts down the output when the die temperature reaches approximately 160°C and resets when the die has cooled to 140°C. Depending on load and signal conditions, the thermal protection circuit may cycle on and off. This limits the dissipation of the amplifier but may have an undesirable effect on the load.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat sink. For reliable operation, junction temperature should be limited to 125°C maximum. To estimate the margin of safety in a complete design (including heat sink) increase the ambient temperature until the thermal protection is triggered.

Use worst-case load and signal conditions. For good reliability, thermal protection should trigger more than 35°C above the maximum expected ambient condition of your application. This produces a junction temperature of 125°C at the maximum expected ambient condition.

The internal protection circuitry of the OPA549 was designed to protect against overload conditions. It was not intended to replace proper heat sinking. Continuously running the OPA549 into thermal shutdown will degrade reliability.

## Amplifier Mounting and Heat Sinking

Most applications require a heat sink to assure that the maximum operating junction temperature (125°C) is not exceeded. In addition, the junction temperature should be kept as low as possible for increased reliability. Junction temperature can be determined according to the Equations:

$$T_J = T_A + P_D \theta_{JA} \quad (4)$$

$$\theta_{JA} = \theta_{JC} + \theta_{CH} + \theta_{HA} \quad (5)$$

Where:

$T_J$  = Junction Temperature (°C)

$T_A$  = Ambient Temperature (°C)

$P_D$  = Power Dissipated (W)

$\theta_{JC}$  = Junction-to-Case Thermal Resistance (°C/W)

$\theta_{CH}$  = Case-to-Heat Sink Thermal Resistance (°C/W)

$\theta_{HA}$  = Heat Sink-to-Ambient Thermal Resistance (°C/W)

$\theta_{JA}$  = Junction-to-Air Thermal Resistance (°C/W)

[Figure 9](#) shows maximum power dissipation versus ambient temperature with and without the use of a heat sink. Using a heat sink significantly increases the maximum power dissipation at a given ambient temperature, as shown in [Figure 9](#).

The challenge in selecting the heat sink required lies in determining the power dissipated by the OPA549. For dc output, power dissipation is simply the load current times the voltage developed across the conducting output transistor,  $P_D = I_L (V_S - V_O)$ . Other loads are not as simple. Consult the [SBOA022](#) Application Report for further insight on calculating power dissipation. Once power dissipation for an application is known, the proper heat sink can be selected.

**Heat Sink Selection Example**

An 11-lead power ZIP package is dissipating 10 Watts. The maximum expected ambient temperature is 40°C. Find the proper heat sink to keep the junction temperature below 125°C (150°C minus 25°C safety margin).

Combining Equation 4 and Equation 5 gives:

$$T_J = T_A + P_D (\theta_{JC} + \theta_{CH} + \theta_{HA}) \tag{6}$$

$T_J$ ,  $T_A$ , and  $P_D$  are given.  $\theta_{JC}$  is provided in the Specifications Table, 0.1°C/W (dc).  $\theta_{CH}$  can be obtained from the heat sink manufacturer. Its value depends on heat sink size, area, and material used. Semiconductor package type, mounting screw torque, insulating material used (if any), and thermal joint compound used (if any) also affect  $\theta_{CH}$ . A typical  $\theta_{CH}$  for a mounted 11-lead power ZIP package is 0.5°C/W. Now we can solve for  $\theta_{HA}$ :

$$\theta_{HA} = [(T_J - T_A)/P_D] - \theta_{JC} - \theta_{CH}$$

$$\theta_{HA} = [(125^\circ\text{C} - 55^\circ\text{C})/10 \text{ W}] - 0.1^\circ\text{C/W} - 0.5^\circ\text{C/W}$$

$$\theta_{HA} = 6.4^\circ\text{C/W}$$

To maintain junction temperature below 125°C, the heat sink selected must have a  $\theta_{HA}$  less than 6.4°C/W. In other words, the heat sink temperature rise above ambient must be less than 64°C (6.4°C/W • 10 W). For example, at 10 W, Thermalloy model number 6396B has a heat sink temperature rise of 56°C ( $\theta_{HA} = 56^\circ\text{C}/10 \text{ W} = 5.6^\circ\text{C/W}$ ), which is below the required 66°C required in this example. Thermalloy model number 6399B has a sink temperature rise of 33°C ( $\theta_{HA} = 33^\circ\text{C}/10 \text{ W} = 3.3^\circ\text{C/W}$ ), which is also below the required 66°C required in this example. Figure 9 shows power dissipation versus ambient temperature for a 11-lead power ZIP package with the Thermalloy 6396B and 6399B heat sinks.

**Figure 9. Maximum Power Dissipation vs Ambient Temperature**

Another variable to consider is natural convection versus forced convection air flow. Forced-air cooling by a small fan can lower  $\theta_{CA}$  ( $\theta_{CH} + \theta_{HA}$ ) dramatically. Some heat sink manufacturers provide thermal data for both of these cases. Heat sink performance is generally specified under idealized conditions that may be difficult to achieve in an actual application. For additional information on determining heat sink requirements, consult Application Report (SBOA021).

As mentioned earlier, once a heat sink has been selected, the complete design should be tested under worst-case load and signal conditions to ensure proper thermal protection. Any tendency to activate the thermal protection circuitry may indicate inadequate heat sinking.

The tab of the 11-lead power ZIP package is electrically connected to the negative supply,  $V_-$ . It may be desirable to isolate the tab of the 11-lead power ZIP package from its mounting surface with a mica (or other film) insulator. For lowest overall thermal resistance, it is best to isolate the entire heat sink/OPA549 structure from the mounting surface rather than to use an insulator between the semiconductor and heat sink.

### Output Stage Compensation

The complex load impedances common in power op amp applications can cause output stage instability. For normal operation, output compensation circuitry is typically not required. However, for difficult loads or if the OPA549 is intended to be driven into current limit, an R/C network may be required. Figure 10 shows an output R/C compensation (snubber) network which generally provides excellent stability.

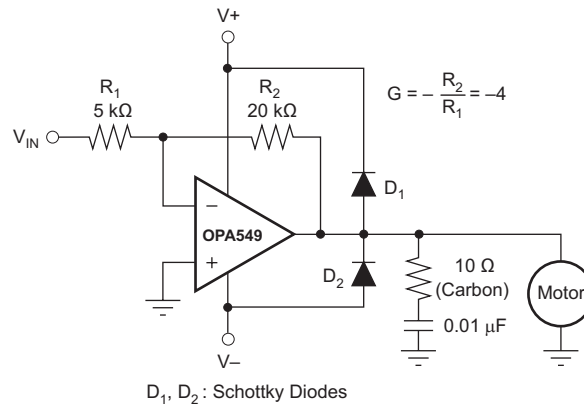

Figure 10. Motor Drive Circuit

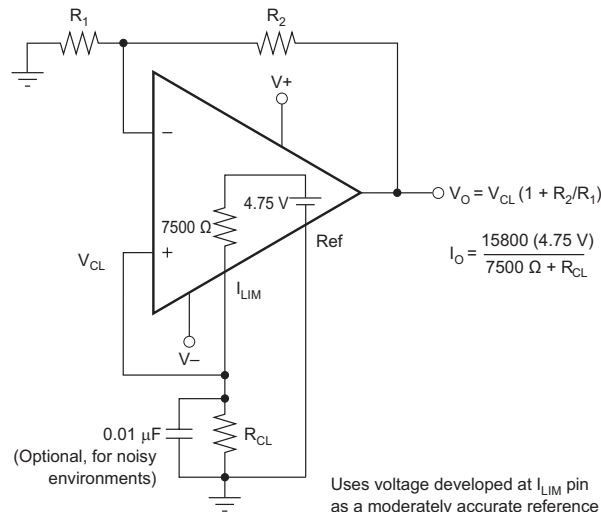

A snubber circuit may also enhance stability when driving large capacitive loads ( $> 1000$  pF) or inductive loads (motors, loads separated from the amplifier by long cables). Typically, 3-Ω to 10-Ω resistors in series with 0.01-μF to 0.1-μF capacitors is adequate. Some variations in circuit values may be required with certain loads.

### Output Protection

Reactive and EMF-generating loads can return load current to the amplifier, causing the output voltage to exceed the power-supply voltage. This damaging condition can be avoided with clamp diodes from the output terminal to the power supplies, as shown in Figure 10. Schottky rectifier diodes with an 8-A or greater continuous rating are recommended.

### Voltage Source Application

Figure 11 illustrates how to use the OPA549 to provide an accurate voltage source with only three external resistors. First, the current limit resistor,  $R_{CL}$ , is chosen according to the desired output current. The resulting voltage at the  $I_{LIM}$  pin is constant and stable over temperature. This voltage,  $V_{CL}$ , is connected to the noninverting input of the op amp and used as a voltage reference, thus eliminating the need for an external reference. The feedback resistors are selected to gain  $V_{CL}$  to the desired output voltage level.

$$V_O = V_{CL} (1 + R_2/R_1)$$

$$I_O = \frac{15800 (4.75 V)}{7500 \Omega + R_{CL}}$$

Uses voltage developed at  $I_{LIM}$  pin as a moderately accurate reference voltage.

For Example:  
 If  $I_{LIM} = 7.9 A$ ,  $R_{CL} = 2 k\Omega$   
 $V_{CL} = \frac{2 k\Omega \cdot 4.75 V}{(2k \Omega + 7500 \Omega)} = 1 V$   
 Desired  $V_O = 10 V$ ,  $G = \frac{10}{1} = 10$   
 $R_1 = 1 k\Omega$  and  $R_2 = 9 k\Omega$

Figure 11. Voltage Source

**Programmable Power Supply**

A programmable source and sink power supply can easily be built using the OPA549. Both the output voltage and output current are user-controlled. See Figure 12 for a circuit using potentiometers to adjust the output voltage and current while Figure 13 uses DACs. An LED connected to the E/S pin through a logic gate indicates if the OPA549 is in thermal shutdown.

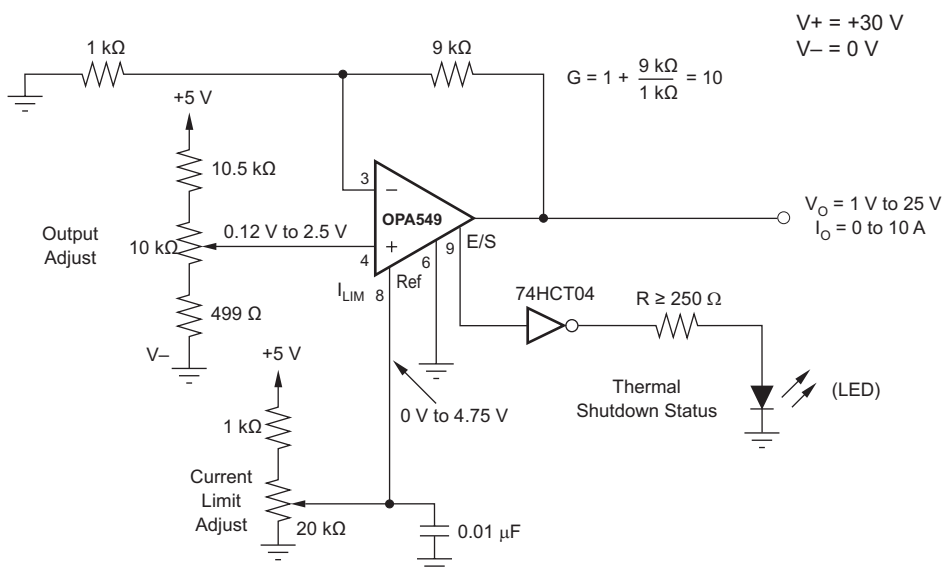

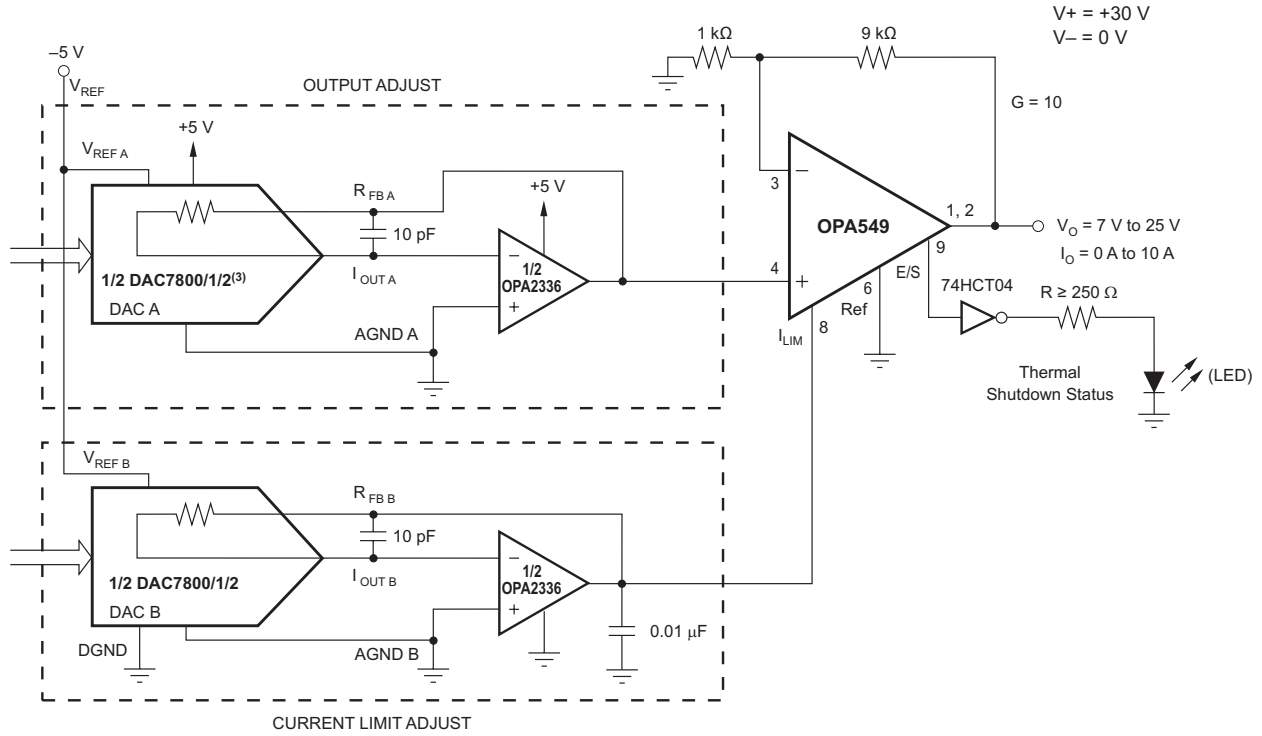

Figure 12. Resistor-Controlled Programmable Power Supply

Choose DAC780X based on digital interface: DAC7800—12-bit interface, DAC7801—8-bit interface + 4 bits, DAC7802—serial interface.

Figure 13. Digitally-Controlled Programmable Power Supply

Limit output slew rates to ≤ 3 V/μs (see text).

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
OPA549MKVC	ACTIVE	Power Package	KVC	11	25	RoHS & Green	SN	N / A for Pkg Type	-55 to 125	OPA549M	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
