

TCAN340x-Q1 具有待机模式和 $\pm 58V$ 总线关断电压的 3.3V 汽车级 CAN FD 收发器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
- 3.3V 单电源工作
 - 无需使用 5V 稳压器，从而节省 BOM 成本并减小 PCB 空间
- 在同构和异构网络中实现出色的 EMC 运行
- 符合 ISO 11898-2:2016 物理层标准要求
- 功能安全型
 - 可提供用于功能安全系统设计的文档
- 支持传统 CAN 和经优化的 CAN FD 性能 (数据速率为 2Mbps、5Mbps 和 8Mbps)
 - 具有较短的对称传播延迟时间，可增加时序裕量
- TCAN3403-Q1：I/O 电压范围支持：1.7V 至 3.6V
- 接收器共模输入电压： $\pm 30V$
- 保护特性：
 - 总线故障保护： $\pm 58V$
 - 总线引脚上提供 ISO 10605 ESD： $\pm 8kV$
 - 欠压保护
 - TXD 显性超时 (DTO)
 - 热关断保护 (TSD)
- 工作模式：
 - 正常模式
 - 支持远程唤醒请求功能的低功耗待机模式
 - 超低功耗关断模式：
 - 仅限 TCAN3404-Q1
- 优化了未上电时的性能
 - 总线和逻辑引脚为高阻抗 (运行总线或应用上无负载)
 - 支持热插拔：在总线和 RXD 输出上可实现上电和断电无干扰运行
- 具有可湿性侧面的小型 8 引脚 SOIC SOT-23 和无引线 VSON-8 封装，可实现自动光学检测 (AOI)

2 应用

- 汽车和运输
 - 车身控制模块
 - 汽车网关
 - 高级驾驶辅助系统 (ADAS)
 - 信息娱乐系统

3 说明

TCAN3403-Q1 和 TCAN3404-Q1 是 3.3V 控制器局域网 (CAN) FD 收发器，满足 ISO 11898-2:2016 高速 CAN 规范的物理层要求。

此类收发器具有经过认证的电磁兼容性 (EMC)，适用于数据速率高达 5 兆位/秒 (Mbps) 的传统 CAN 和 CAN FD 网络。这些器件可以在更简单的网络中实现高达 8Mbps 的运行速度。TCAN3403-Q1 包括通过 V_{IO} 引脚实现的内部逻辑电平转换功能，能够将收发器 I/O 直接连接到 1.8V、2.5V 或 3.3V 逻辑电平。TCAN3404-Q1 具有关断功能，可将所有块断电并使器件进入超低功耗模式。此类收发器支持低功耗待机模式，并且可通过符合 ISO 11898-2:2016 所定义唤醒模式 (WUP) 的 CAN 来唤醒。

此类收发器可进行热关断 (TSD)、TXD 显性超时 (DTO) 和电源欠压检测。这些器件定义了电源欠压或浮动引脚情况下的失效防护行为。这些器件采用业界通用的 SOIC-8、VSON-8 和节省空间的小尺寸 SOT-23 封装。

封装信息

器件型号	封装 ⁽¹⁾	封装尺寸 ⁽²⁾
TCAN3403-Q1	SOIC (D)	4.9mm x 6mm
TCAN3404-Q1	VSON (DRB)	3mm x 3mm
	SOT-23 (DDF)	2.9mm x 2.8mm

(1) 有关更多信息，请参阅节 12。

(2) 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

4 Device Comparison

Part Number	Pin 5	Pin 8
TCAN3404-Q1	Ultra-low power shutdown mode	Low Power Standby Mode with Remote Wake
TCAN3403-Q1	Low voltage I/O support	

5 Pin Configuration and Functions

图 5-1. DDF Package, 8-Pin SOT-23 (Top View)

图 5-2. D Package, 8-Pin SOIC (Top View)

图 5-3. DRB Package, 8-Pin VSON (Top View)

表 5-1. Pin Functions

PINS		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
TXD	1	Digital Input	CAN transmit data input; integrated pull-up
GND	2	G	Ground connection
V _{CC}	3	Supply	3.3V supply voltage
RXD	4	Digital Output	CAN receive data output, tri-stated when device powered off
SHDN	5	Digital Input	Device in ultra-low power shutdown mode if pin is high; integrated pull-down (TCAN3404-Q1 only)
V _{IO}		Supply	I/O supply voltage (TCAN3403-Q1 only)
CANL	6	Bus I/O	Low-level CAN bus input/output line
CANH	7	Bus I/O	High-level CAN bus input/output line
STB	8	Digital Input	Standby input for mode control; integrated pull-up
Thermal Pad (VSON only)		—	Connect the thermal pad to any internal PCB ground plane using multiple vias for optimal thermal performance.

(1) I = Input, O = Output, I/O = Input or Output, G = Ground.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾ ⁽²⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage	- 0.3	6	V
V _{IO}	Supply voltage I/O level shifter (only for TCAN3403)	- 0.3	6	V
V _{BUS}	CAN bus I/O voltage range on CANH and CANL	- 58	58	V
V _{DIFF}	Max differential voltage between CANH and CANL V _{DIFF} = (CANH - CANL)	- 58	58	V
V _{Logic_Input}	Logic pin input voltage (TXD, STB, SHDN)	- 0.3	6	V
V _{RXD}	Logic output voltage range (RXD)	- 0.3	6	V
I _{O(RXD)}	RXD output current	- 8	8	mA
T _J	Junction temperature	- 40	165	°C
T _{STG}	Storage temperature	- 65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values, except differential I/O bus voltages, are with respect to ground terminal.

6.2 ESD Ratings

			VALUE	UNIT	
V _{ESD}	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	HBM classification level 3A for all pins	±4000	V
			HBM classification level 3B for global pins CANH and CANL with respect to GND	±10000	V
		Charged-device model (CDM), per AEC Q100-011 CDM classification level C5 for all pins		±750	V

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 ESD Ratings, IEC Transients

			VALUE	UNIT	
V _{ESD}	System level electrostatic discharge	CAN bus terminals (CANH, CANL) to GND	SAE J2962-2 per ISO 10605 Powered contact discharge	±8000	V
			SAE J2962-2 per ISO 10605 Powered air discharge	±15000	V
			IEC 62228-3 per ISO 10605	±8000	V
V _{Tran}	ISO 7637-2 Transient immunity ⁽¹⁾	CAN bus terminals (CANH, CANL) to GND	Pulse 1	- 100	V
			Pulse 2a	75	V
			Pulse 3a	- 150	V
			Pulse 3b	100	V
	Direct capacitor coupling, SAE J2962-2 per ISO 7637-3 ⁽²⁾	CAN bus terminals (CANH, CANL) to GND	DCC slow transient pulse	±30	V

- (1) Tested according to IEC 62228-3:2019 CAN Transceivers, Section 6.3; standard pulses parameters defined in ISO 7637-2 (2011)
- (2) Tested according to SAE J2962-2

6.4 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage	3	3.3	3.6	V

6.4 Recommended Operating Conditions (续)

		MIN	NOM	MAX	UNIT
V _{IO}	Supply voltage for I/O level shifter (only for TCAN3403)	1.7		3.6	V
I _{OH(RXD)}	RXD terminal high-level output current	- 2			mA
I _{OL(RXD)}	RXD terminal low-level output current			2	mA
I _{OH(RXD)}	RXD terminal high-level output current (only for TCAN3403)	- 1.5			mA
I _{OL(RXD)}	RXD terminal low-level output current (only for TCAN3403)			1.5	mA
T _J	Junction temperature	- 40		150	°C

6.5 Thermal Characteristics

THERMAL METRIC ⁽¹⁾		TCAN3403/3404-Q1			UNIT
		D (SOIC)	DDF (SOT)	DRB (VSON)	
R _{eJA}	Junction-to-ambient thermal resistance	114.4	122.9	50.9	°C/W
R _{eJC(top)}	Junction-to-case (top) thermal resistance	49.0	51.7	55.8	°C/W
R _{eJB}	Junction-to-board thermal resistance	58.0	45.7	23.2	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	7.0	1.3	1.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	57.1	45.4	23.2	°C/W
R _{eJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	N/A	7.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.6 Supply Characteristics

parameters valid over recommended operating conditions with $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (Typical values are at V_{CC} = 3.3 V; V_{IO} = 3.3 V for TCAN3403, Device ambient maintained at 27°C) unless otherwise noted

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I _{CC}	Supply current normal mode	Dominant	TXD = 0 V, STB = 0 V R _L = 60 Ω, C _L = open See 图 7-1		42	55	mA
		Dominant	TXD = 0 V, STB = 0 V R _L = 50 Ω, C _L = open See 图 7-1		50	60	mA
		Recessive	TXD = V _{CC} , STB = 0 V R _L = 50 Ω, C _L = open See 图 7-1		7	8.2	mA
I _{CC}	Supply current normal mode	Dominant with bus fault	TXD = 0 V, STB = 0 V CANH = CANL = ±25 V R _L = open, C _L = open See 图 7-1			130	mA
			TXD = STB = V _{IO} , R _L = 50 Ω, C _L = open, T _J ≤ 85 °C, See 图 7-1		1	2	μA
	TXD = STB = V _{IO} , R _L = 50 Ω, C _L = open, T _J ≤ 125 °C, See 图 7-1		1	3			
	TXD = STB = V _{IO} , R _L = 50 Ω, C _L = open, T _J ≤ 150 °C, See 图 7-1		1	4			
	Supply current standby mode (TCAN3404)		TXD = STB = V _{CC} , R _L = 50 Ω, C _L = open, T _J ≤ 85 °C, See 图 7-1		10	15	μA
			TXD = STB = V _{CC} , R _L = 50 Ω, C _L = open, T _J ≤ 125 °C, See 图 7-1		10	16	
TXD = STB = V _{CC} , R _L = 50 Ω, C _L = open, T _J ≤ 150 °C, See 图 7-1				10	17		

6.6 Supply Characteristics (续)

parameters valid over recommended operating conditions with $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (Typical values are at $V_{CC} = 3.3\text{ V}$; $V_{IO} = 3.3\text{ V}$ for TCAN3403, Device ambient maintained at 27°C) unless otherwise noted

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_{IO} (only for TCAN3403)	I/O supply current normal mode	Dominant	TXD = 0 V, STB = 0 V $R_L = 60\ \Omega$, $C_L = \text{open}$ RXD floating		125	300	μA
		recessive	TXD = V_{IO} , STB = 0 V $R_L = 60\ \Omega$, $C_L = \text{open}$ RXD floating		19	48	
	I/O supply current standby mode		TXD = V_{IO} , STB = V_{IO} $R_L = 60\ \Omega$, $C_L = \text{open}$ RXD floating, $T_J \leq 85^{\circ}\text{C}$		9	13	
			TXD = V_{IO} , STB = V_{IO} $R_L = 60\ \Omega$, $C_L = \text{open}$ RXD floating, $T_J \leq 125^{\circ}\text{C}$		9	14	
		TXD = V_{IO} , STB = V_{IO} $R_L = 60\ \Omega$, $C_L = \text{open}$ RXD floating, $T_J \leq 150^{\circ}\text{C}$		9	15

8 Detailed Description

8.1 Overview

The TCAN340x-Q1 devices are automotive EMC compliant 3.3V CAN FD transceivers. The devices are data rate agnostic making them backward compatible for supporting classical CAN applications while also supporting CAN FD networks up to 8Mbps. These devices have standby mode support which puts the transceiver in low current consumption mode. Upon receiving valid wake-up pattern on CAN bus, the device signals to the microcontroller through the RXD pin. The MCU can then place the device in normal mode using STB pin.

TCAN3404-Q1 supports ultra-low power shutdown mode where most of the internal blocks are disabled. This feature is optimized for battery-powered applications. TCAN3403-Q1 supports V_{IO} pin for low voltage logic level interface. The device can be interfaced to 1.8V, 2.5V or 3.3V micro controllers.

8.2 Functional Block Diagram

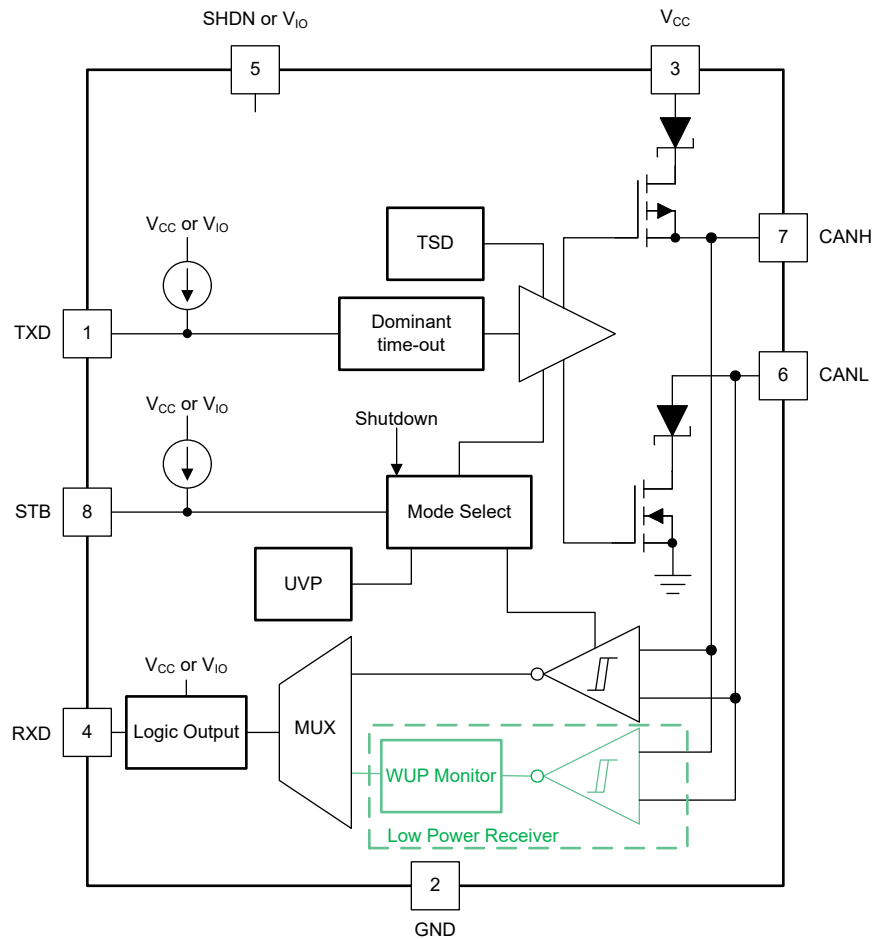

图 8-1. Block Diagram

8.3 Feature Description

8.3.1 Pin Description

8.3.1.1 TXD

The TXD input is a logic-level signal from a CAN controller to the transceiver. It is referenced to V_{CC} for TCAN3404-Q1 or to V_{IO} for TCAN3403-Q1 device.

8.3.1.2 GND

GND is the ground pin of the transceiver. The pin must be connected to the PCB ground.

8.3.1.3 V_{CC}

V_{CC} provides the 3.3 V power supply to the CAN transceiver.

8.3.1.4 RXD

The RXD output is a logic-level signal from the CAN transceiver to the CAN controller. It is referenced to V_{CC} for TCAN3404-Q1 and V_{IO} for TCAN3403-Q1. For TCAN3403-Q1, this pin is only driven once V_{IO} is present.

When a CAN bus wakeup event takes place, RXD is driven low

8.3.1.5 V_{IO} (TCAN3403-Q1 only)

The V_{IO} pin provides the digital I/O voltage to match the CAN controller voltage thus avoiding the requirement for a level shifter. It supports voltages from 1.7V to 3.6V providing a wide range of controller support.

8.3.1.6 CANH and CANL

The CANH and CANL pins are the CAN high and CAN low differential bus pins. These pins are internally connected to the CAN transmitter, receiver and the low-power wake-up receiver.

8.3.1.7 STB (Standby)

The STB pin is an input pin used for mode control of the transceiver. The STB pin can be supplied from either the system processor or from a static system voltage source. STB pin has default pull-up resistor on-chip. So if the pin is left floating or pulled high externally, device is in standby mode. If normal mode is the only intended mode of operation, the STB pin can be tied directly to GND.

8.3.1.8 SHDN (Shutdown)

The SHDN pin is only applicable to TCAN3404-Q1 and is used to put the device in ultra-low power mode. SHDN pin has an internal pull-down resistor on-chip, so if the pin is left floating, the device is in normal mode or standby mode depending on the state of STB pin. Pulling SHDN pin high externally puts the device in shutdown. All blocks (including low power wakeup receiver) are disabled in this mode. SHDN pin has higher priority compared to STB pin.

8.3.2 CAN Bus States

The CAN bus has two logical states during operation: recessive and dominant. See [图 8-2](#) and [图 8-3](#).

A dominant bus state occurs when the bus is driven differentially and corresponds to a logic low on the TXD and RXD pins. A recessive bus state occurs when the bus is biased to roughly V_{CC}/2 via the high-resistance internal input resistors (R_{IN}) of the receiver and corresponds to a logic high on the TXD and RXD pins.

A dominant state overwrites the recessive state during arbitration. Multiple CAN nodes may be transmitting a dominant bit at the same time during arbitration, and in this case the differential voltage of the bus is greater than the differential voltage of a single driver.

The TCAN340x-Q1 transceivers implement a low-power standby (STB) mode which enables a third bus state where the bus pins are weakly biased to ground via the high resistance internal resistors of the receiver. See [图 8-2](#) and [图 8-3](#).

图 8-2. Bus States

A - Normal Mode B - Standby Mode

图 8-3. Simplified Recessive Common Mode Bias Unit and Receiver

8.3.3 TXD Dominant Timeout (DTO)

During normal mode, the only mode where the CAN driver is active, the TXD DTO circuit prevents the local node from blocking network communication in the event of a hardware or software failure where TXD is held dominant longer than the timeout period t_{TXD_DTO} . The TXD DTO circuit is triggered by a falling edge on TXD. If no rising edge is seen before the timeout period of the circuit, t_{TXD_DTO} , the CAN driver is disabled. This frees the bus for communication between other nodes on the network. The CAN driver is reactivated when a recessive signal is seen on the TXD pin; thus, clearing the dominant time out. The receiver remains active and biased to approximately 1.9V and the RXD output reflects the activity on the CAN bus during the TXD DTO fault.

The minimum dominant TXD time allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. The minimum transmitted data rate may be calculated using 方程式 1.

$$\text{Minimum Data Rate} = 11 \text{ bits} / t_{TXD_DTO} = 11 \text{ bits} / 1.2\text{ms} = 9.2\text{kbps} \quad (1)$$

图 8-4. Example Timing Diagram for TXD Dominant Timeout

8.3.4 CAN Bus short-circuit current limiting

The devices have several protection features that limit the short-circuit current when a CAN bus line is shorted. These include CAN driver current limiting in the dominant and recessive states and TXD dominant state timeout which prevents permanently having the higher short-circuit current of a dominant state in case of a system fault. During CAN communication the bus switches between the dominant and recessive states, thus the short-circuit current may be viewed as either the current during each bus state or as a DC average current. When selecting termination resistors or a common-mode choke for the CAN design the average power rating, $I_{OS(AVG)}$, should be used. The percentage dominant is limited by the TXD DTO and the CAN protocol which has forced state changes and recessive bits due to bit stuffing, control fields, and interframe space. making sure there is a minimum amount of recessive time on the bus even if the data field contains a high percentage of dominant bits.

The average short-circuit current of the bus depends on the ratio of recessive to dominant bits and the respective short-circuit currents. The average short-circuit current may be calculated using 方程式 2.

$$I_{OS(AVG)} = \% \text{ Transmit} \times [(\% \text{ REC_Bits} \times I_{OS(SS)_REC}) + (\% \text{ DOM_Bits} \times I_{OS(SS)_DOM})] + [\% \text{ Receive} \times I_{OS(SS)_REC}] \quad (2)$$

Where:

- $I_{OS(AVG)}$ is the average short-circuit current
- % Transmit is the percentage the node is transmitting CAN messages
- % Receive is the percentage the node is receiving CAN messages
- % REC_Bits is the percentage of recessive bits in the transmitted CAN messages
- % DOM_Bits is the percentage of dominant bits in the transmitted CAN messages
- $I_{OS(SS)_REC}$ is the recessive steady state short-circuit current
- $I_{OS(SS)_DOM}$ is the dominant steady state short-circuit current

This short circuit current and the possible fault cases of the network should be taken into consideration when sizing the power supply used to generate the transceivers V_{CC} supply.

8.3.5 Thermal Shutdown (TSD)

If the junction temperature of the devices exceed the thermal shutdown threshold, T_{TSD} , the device turns off the CAN driver circuitry and blocks the TXD to bus transmission path. The shutdown condition is cleared when the

junction temperature of the device drops below T_{TSD} . The CAN bus pins are biased to approximately 1.9V during a TSD fault and the receiver to RXD path remains operational. The TCAN340x-Q1 TSD circuit includes hysteresis which prevents the CAN driver output from oscillating during a TSD fault.

8.3.6 Undervoltage Lockout

The supply pins, V_{CC} and V_{IO} , have undervoltage detection that places the device into a protected state. This protects the bus during an undervoltage event on either supply pin.

表 8-1. Undervoltage Lockout - TCAN3404-Q1

V_{CC}	DEVICE STATE	BUS	RXD PIN
$> UV_{VCC}$	Normal if STB = GND and SHDN = GND	Per TXD	Mirrors bus
$> UV_{VCC}$	Standby mode if STB = High and SHDN = GND	Weak biased to GND	V_{CC} , Remote wake request See Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode
$> UV_{VCC}$	Shutdown mode if SHDN = High	Weak biased to GND	V_{CC}
$< UV_{VCC}$	Protected	High impedance	High impedance

表 8-2. Undervoltage Lockout - TCAN3403-Q1

V_{CC}	V_{IO}	DEVICE STATE	BUS	RXD PIN
$> UV_{VCC}$	$> UV_{VIO}$	Normal	Per TXD	Mirrors bus
$< UV_{VCC}$	$> UV_{VIO}$	STB = High: Standby Mode	Weak biased to GND	V_{IO} : Remote wake request See Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode
		STB =Low: Protected Mode	High impedance	Recessive
$> UV_{VCC}$	$< UV_{VIO}$	Protected	High impedance	High impedance
$< UV_{VCC}$	$< UV_{VIO}$	Protected	High impedance	High impedance

Once the undervoltage condition is cleared, and t_{MODE} or t_{SHDN2} has expired, the TCAN340x-Q1 transitions to normal mode and the host controller can again send and receive CAN traffic.

8.3.7 Unpowered Device

For unpowered condition, the TCAN340x-Q1 is designed to be a passive or no load to the CAN bus. This is because the bus pins were designed to have low leakage currents to not load the bus. This design consideration is critical if some nodes of the network are unpowered while the rest of the network remains operational.

For unpowered scenario, the logic pins also have low leakage currents. The pins do not load other circuits which may remain powered.

8.3.8 Floating pins

The TCAN340x-Q1 devices have internal pull-up/pull-down resistors on critical pins which place the device into known states if the pin floats. This internal bias should not be relied upon by design though, especially in noisy environments, but instead should be considered a failsafe protection feature.

When a CAN controller supporting open-drain outputs is used an adequate external pull-up resistor must be chosen. This makes sure the TXD output of the CAN controller maintains acceptable bit time to the input of the CAN transceiver. See [表 8-3](#) for details on pin bias conditions.

表 8-3. Pin Bias

Pin	Pull-up or Pull-down	Comment
TXD	Pull-up	Weakly biases TXD towards recessive to prevent bus blockage or TXD DTO triggering

表 8-3. Pin Bias (续)

Pin	Pull-up or Pull-down	Comment
STB	Pull-up	Weakly biases STB towards low-power standby mode to prevent excessive system power
SHDN	Pull-down	Weakly biases SHDN towards normal mode to allow normal communication. SHDN pin has higher priority than STB for TCAN3404.

8.4 Device Functional Modes

8.4.1 Operating Modes

The TCAN340x-Q1 has two main operating modes; normal mode and standby mode. Operating mode selection is made by applying a high or low level to the STB pin. TCAN3404-Q1 has a third mode: shutdown activated through SHDN pin. Pulling SHDN pin high disables most internal blocks and puts the device in lowest power consumption mode.

表 8-4. Operating Modes for STB pin

STB	Device Mode	Driver	Receiver	RXD Pin
High	Low current standby mode with bus wake-up	Disabled	Low-power receiver and bus monitor enable	High (recessive) until valid WUP is received See Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode
Low	Normal Mode	Enabled	Enabled	Mirrors bus state

8.4.2 Normal Mode

This is the normal operating mode of the TCAN340x-Q1. The CAN driver and receiver are fully operational and CAN communication is bi-directional. The driver is translating a digital input on the TXD input to a differential output on the CANH and CANL bus pins. The receiver is translating the differential signal from CANH and CANL to a digital output on the RXD output.

8.4.3 Standby Mode

This is the low-power mode of the TCAN340x-Q1. The CAN driver and main receiver are switched off and bi-directional CAN communication is not possible. The low-power receiver and bus monitor circuits are enabled to allow for RXD wake-up requests via the CAN bus. A wake-up request is output to RXD as shown in [图 8-5](#). The local CAN protocol controller should monitor RXD for transitions (high-to-low) and reactivate the device to normal mode by pulling the STB pin low. The CAN bus pins are weakly pulled to GND in this mode; see [图 8-2](#) and [图 8-3](#).

For TCAN3403-Q1 in standby mode, only the V_{IO} supply is required; therefore, the V_{CC} may be switched off for additional system level current savings.

8.4.3.1 Remote Wake Request via Wake-Up Pattern (WUP) in Standby Mode

The TCAN340x-Q1 devices support a remote wake-up request that is used to indicate to the host controller that the bus is active and the node should return to normal operation.

The device uses the multiple filtered dominant wake-up pattern (WUP) from the ISO 11898-2:2016 standard to qualify bus activity. Once a valid WUP has been received, the wake request is indicated to the controller by a falling edge and low period corresponding to a filtered dominant on the RXD output of the device.

The WUP consists of a filtered dominant pulse, followed by a filtered recessive pulse, and finally by a second filtered dominant pulse. The first filtered dominant initiates the WUP, and the bus monitor then waits on a filtered recessive; other bus traffic does not reset the bus monitor. Once a filtered recessive is received the bus monitor is waiting for a filtered dominant and again, other bus traffic does not reset the bus monitor. Immediately upon reception of the second filtered dominant the bus monitor recognizes the WUP and drives the RXD output low every time an additional filtered dominant signal is received from the bus.

For a dominant or recessive to be considered filtered, the bus must be in that state for more than the t_{WK_FILTER} time. Due to variability in t_{WK_FILTER} the following scenarios are applicable. Bus state times less than $t_{WK_FILTER(MIN)}$ are never detected as part of a WUP and thus no wake request is generated. Bus state times between $t_{WK_FILTER(MIN)}$ and $t_{WK_FILTER(MAX)}$ may be detected as part of a WUP and a wake-up request may be generated. Bus state times greater than $t_{WK_FILTER(MAX)}$ are always detected as part of a WUP; therefore, a wake request is always generated. See [图 8-5](#) for the timing diagram of the wake-up pattern.

The pattern and t_{WK_FILTER} time used for the WUP prevents noise and bus stuck dominant faults from causing false wake-up requests while allowing any valid message to initiate a wake-up request.

The ISO 11898-2:2016 standard has defined times for a short and long wake-up filter time. The t_{WK_FILTER} timing for the device has been picked to be within the minimum and maximum values of both filter ranges. This timing has been chosen such that a single bit time at 500kbps, or two back-to-back bit times at 1Mbps triggers the filter in either bus state. Any CAN frame at 500kbps or less would contain a valid WUP.

For an additional layer of robustness and to prevent false wake-ups, the device implements a wake-up timeout feature. For a remote wake-up event to successfully occur, the entire WUP must be received within the timeout value $t \leq t_{WK_TIMEOUT}$. If not, the internal logic is reset and the transceiver remains in the current state without waking up. The full pattern must then be transmitted again, conforming to the constraints mentioned in this section. See [图 8-5](#) for the timing diagram of the wake-up pattern with wake timeout feature.

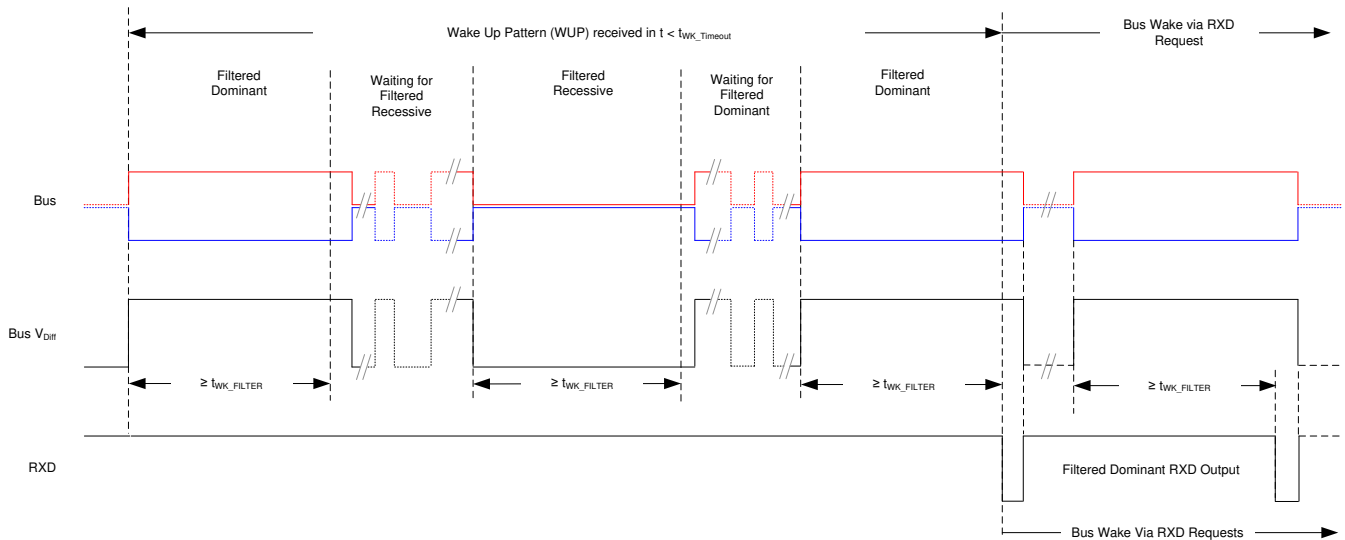

图 8-5. Wake-Up Pattern (WUP) with $t_{WK_TIMEOUT}$

8.4.4 Shutdown Mode

This is the lowest power state of TCAN3404-Q1. All internal blocks including CAN driver, main receiver and low power wake-up receiver are switched off and bi-directional CAN communication is not possible. Wakeup over CAN bus is also not possible in this mode. CAN bus pins are weakly biased towards GND and RXD is high in this state,

8.4.5 Driver and Receiver Function

The TCAN340x-Q1 logic I/Os support CMOS levels with respect to either V_{CC} for 3.3V systems (TCAN3404-Q1) or V_{IO} (TCAN3403-Q1) for compatibility with MCUs that support 1.8V, 2.5V, or 3.3V systems.

表 8-5. Driver Function Table

Device Mode	TXD Input ⁽¹⁾	Bus Outputs		Driven Bus State ⁽²⁾
		CANH	CANL	
Normal	Low	High	Low	Dominant
	High or open	High impedance	High impedance	Biased recessive
Standby	X	High impedance	High impedance	Biased to ground
Shutdown	X	High impedance	High impedance	Biased to ground

(1) X = irrelevant

(2) For bus state and bias see 图 8-2 and 图 8-3

表 8-6. Receiver Function Table Normal and Standby Mode

Device Mode	CAN Differential Inputs $V_{ID} = V_{CANH} - V_{CANL}$	Bus State	RXD Pin
Normal	$V_{ID} \geq 0.9V$	Dominant	Low
	$0.5V < V_{ID} < 0.9V$	Undefined	Undefined
	$V_{ID} \leq 0.5V$	Recessive	High
Standby	$V_{ID} \geq 1.15V$	Dominant	High Low if a remote wake event occurred See 图 8-5
	$0.4V < V_{ID} < 1.15V$	Undefined	
	$V_{ID} \leq 0.4V$	Recessive	
Any	Open ($V_{ID} \approx 0V$)	Open	High

9 Application Information Disclaimer

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

9.2 Typical Application

The TCAN340x-Q1 transceiver can be used in applications with a host controller or FPGA that includes the link layer portion of the CAN protocol. 图 9-1 shows a typical configuration for 3.3V controller applications. The bus termination is shown for illustrative purposes.

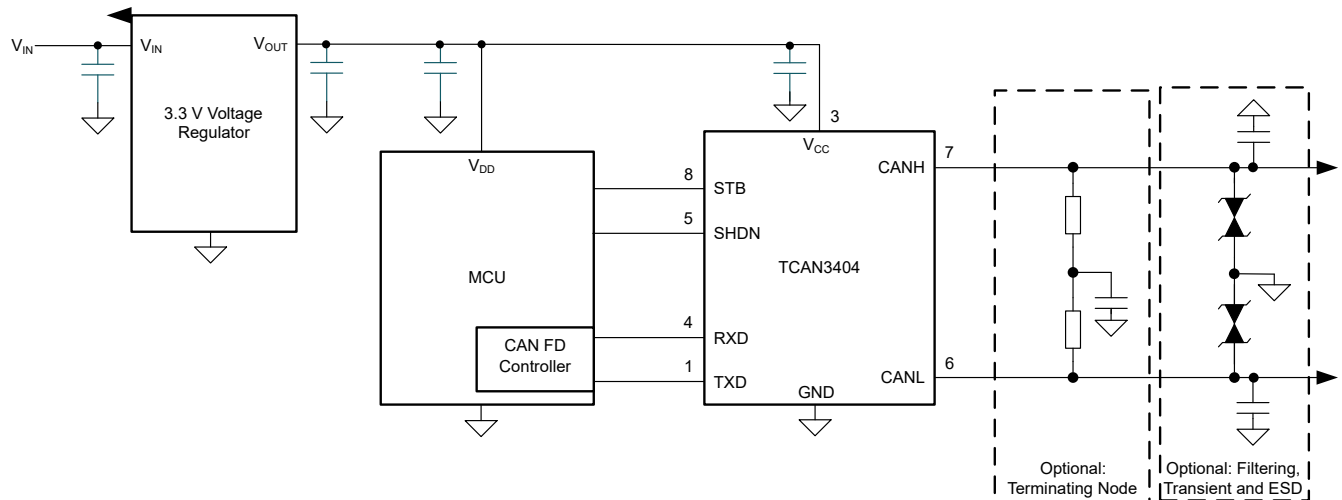

图 9-1. Transceiver Application Using 3.3V I/O Connections

9.2.1 Design Requirements

9.2.1.1 CAN Termination

Termination may be a single 120Ω resistor at each end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common-mode voltage of the bus is desired, then split termination can be used, see 图 9-2. Split termination improves the electromagnetic emissions behavior of the network by filtering higher-frequency common-mode noise that may be present on the differential signal lines.

图 9-2. CAN Bus Termination Concepts

9.2.2 Detailed Design Procedures

9.2.2.1 Bus Loading, Length and Number of Nodes

A typical CAN application may have a maximum bus length of 40 meters and maximum stub length of 0.3m. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A high number of nodes requires a transceiver with high input impedance such as the TCAN340x-Q1.

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898-2 standard. There are many system level trade off decisions for data rate, cable length, and parasitic loading of the bus. Examples of these CAN systems level specifications are ARINC 825, CANopen, DeviceNet, SAE J2284, SAE J1939, and NMEA 2000.

A CAN network system design is a series of tradeoffs. In the ISO 11898-2:2016 specification, the driver differential output is specified with a bus load that can range from $50\ \Omega$ to $65\ \Omega$ where the differential output must be greater than 1.5V. The TCAN340x-Q1 family is specified to meet the 1.5V requirement down to $50\ \Omega$ and is specified to meet 1.4V differential output at $45\text{-}\Omega$ bus load. The differential input resistance of the TCAN340x-Q1 is a minimum of $22\text{k}\ \Omega$. If 55 TCAN340x-Q1 transceivers are in parallel on a bus, this is equivalent to a $400\ \Omega$ differential load in parallel with the nominal $60\text{-}\Omega$ bus termination which gives a total bus load of approximately $52\ \Omega$. Therefore, the TCAN340x-Q1 family theoretically supports over 50 transceivers on a single bus segment. However, for a CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, timing, network imbalances, ground offsets, and signal integrity thus a practical maximum number of nodes is often lower. Bus length may also be extended beyond 40 meters by careful system design and data rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898-2 CAN standard. However, when using this flexibility, the CAN network system designer must take the responsibility of good network design for robust network operation.

See the application report [SLLA270: Controller Area Network Physical layer requirements](#). This document discusses in detail all system design physical layer parameters.

9.3 System Examples

The TCAN340x-Q1 CAN transceiver is typically used in applications with a host controller or FPGA that includes the link layer portion of the CAN protocol. A 1.8V or 2.5V application is shown in [Figure 9-7](#). The bus termination is shown for illustrative purposes.

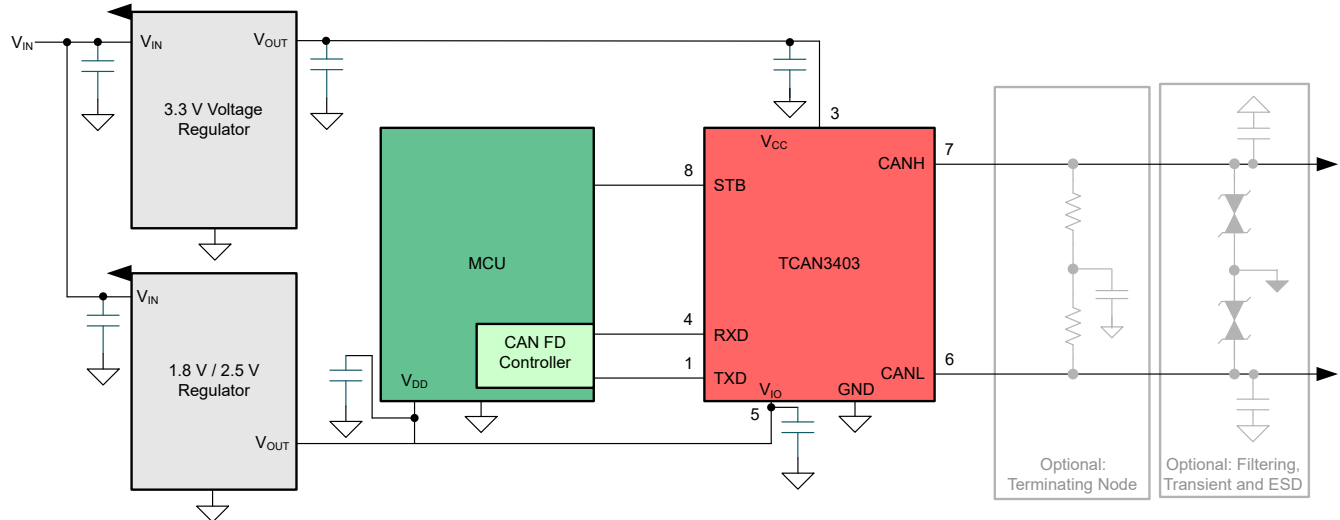

图 9-7. Typical Transceiver Application Using 1.8V, 2.5V I/O Connections

9.3.1 ISO 11898-2 Compatibility of TCAN340x-Q1 Family of 3.3V CAN Transceivers

9.3.1.1 Introduction

Many users value the low power consumption of operating their CAN transceivers from a 3.3V supply. However, some are concerned about the interoperability with 5V supplied transceivers on the same bus. This section tries to address those concerns.

9.3.1.2 Differential Signal

CAN is a differential bus where complementary signals are sent over two wires and the voltage difference between the two wires defines the logical state of the bus. The differential CAN receiver monitors this voltage difference and outputs the bus state with a single ended logic level output signal.

The CAN driver creates the differential voltage between CANH and CANL in the dominant state. The dominant differential output of the TCAN340x-Q1 is greater than 1.5V and less than 3V across a $60\ \Omega$ load as defined by the ISO 11898-2 standard. These are the same limiting values for 5V supplied CAN transceivers. The bus termination resistors drive the recessive bus state and not the CAN driver.

A CAN receiver is required to output a recessive state when less than 500mV of differential voltage exists on the bus, and a dominant state when more than 900mV of differential voltage exists on the bus. The CAN receiver must do this with common-mode input voltages from -12V to 12V . The TCAN340x-Q1 device receivers meet and exceed these receiver input specifications.

9.3.1.3 Common-Mode Signal

A common-mode signal is an average voltage of the two signal wires that the differential receiver rejects. The common-mode signal comes from the CAN driver, ground noise, and coupled bus noise. The TCAN340x-Q1 family has the recessive bias voltage set to 1.9V. This is intentional to match the common mode of recessive output with the common mode of dominant output signal from TCAN340x-Q1. Furthermore, TCAN340x-Q1 has special design techniques for optimum EMC performance in a heterogeneous bus consisting of TCAN340x-Q1 and 5V CAN transceivers.

9.3.1.4 Interoperability of 3.3V CAN in 5V CAN Systems

The 3.3V supplied TCAN340x-Q1 family of CAN transceivers are fully compatible with 5V CAN transceivers. The minimum differential output voltage is the same, and the receivers have the same input threshold specifications. The only difference is in the recessive common mode output voltage which is little lower for 3.3V CAN transceiver than 5V supplied transceiver. But this does not impact regular functionality. Furthermore, special design techniques in TCAN340x-Q1 provide optimum EMC performance in heterogeneous network consisting of TCAN340x-Q1 and 5V supplied CAN transceivers on same CAN bus.

9.4 Power Supply Recommendations

The TCAN3404-Q1 transceiver is designed to operate with a main V_{CC} input voltage supply range between 3V and 3.6V.

The TCAN3403-Q1 implements an I/O level shifting supply input, V_{IO} , designed for a range between 1.8V and 3.6V.

Both the V_{CC} and V_{IO} inputs must be well regulated. In addition to the power supply filtering, a decoupling capacitance, typically 100nF, should be placed near the CAN transceiver main V_{CC} and V_{IO} supply pins.

9.5 Layout

Robust and reliable CAN node designs may require special layout techniques depending on the application and design requirements. Since transient disturbances have high frequency content and a wide bandwidth, high-frequency layout techniques should be applied during PCB design.

9.5.1 Layout Guidelines

- Place the protection and filtering circuitry close to the bus connector, J1, to prevent transients, ESD, and noise from propagating onto the board. This layout example shows an optional transient voltage suppression (TVS) diode, D1, which may be implemented if the system-level requirements exceed the specified rating of the transceiver. This example also shows optional bus filter capacitors C4 and C5.
- Design the bus protection components in the direction of the signal path. Do not force the transient current to divert from the signal path to reach the protection device.
- Decoupling capacitors should be placed as close as possible to the supply pins V_{CC} and V_{IO} of transceiver.
- Use at least two vias for supply and ground connections of bypass capacitors and protection devices to minimize trace and via inductance.

备注

High-frequency current follows the path of least impedance and not the path of least resistance.

- This layout example shows how split termination could be implemented on the CAN node. The termination is split into two resistors, R2 and R3, with the center or split tap of the termination connected to ground via capacitor C3. Split termination provides common mode filtering for the bus. See [CAN Termination](#), [CAN Bus short-circuit limiting](#), and [方程式 2](#) for information on termination concepts and power ratings needed for the termination resistor(s).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
