

TPS6286x 具有 I²C/VSEL 接口的 1.75V 至 5.5V 输入、0.6A/1A 同步降压转换器

1 特性

- 运行静态电流 2.3 μ A
- 高达 4MHz 的开关频率
- 1% 的输出电压精度
- DVS 输出为
 - 0.4V 至 1.9875V (阶跃为 12.5mV)
- 通过 I²C 用户接口进行调节
 - 输出电压预设
 - 斜坡速度
- VSEL 引脚可在工作期间切换输出电压
- 电源正常状态指示
- 支持 < 6mm² 的设计尺寸
- 支持小于 0.6mm 的设计高度
- 微型 8 引脚 0.35mm 间距 WCSP 封装
- 经过优化的引脚排列, 可支持 0201 元件

2 应用

- 可穿戴电子产品
- 便携式电子产品
- 手机
- 医疗传感器贴片和患者监护仪

典型应用

3 说明

TPS6286x 器件是具有 I²C 接口和 VSEL 接口的高频同步降压转换器。这些器件提供了高效、灵活和具有高功率密度的负载点直流/直流设计。该转换器在中高负载条件下以 PWM 模式运行, 并在轻负载时自动进入省电运行模式, 从而在整个负载电流范围内保持高效率。该器件还可强制进入 PWM 运行模式, 以实现最小输出电压纹波。凭借 DCS-Control 架构, 这些器件可实现出色的负载瞬态性能并符合严格的输出电压精度要求。通过 I²C 接口和专用 VSEL 引脚, 可快速调整输出电压, 使负载的功耗适应相关应用不断变化的性能需求。该器件系列提供两个 VSEL 引脚和四个出厂预设电压, 支持在没有 I²C 接口的情况下使用。

(1) Normal operation: default value of operation mode[7] of Vout Register 2 = 0 (表 8-3).

(2) FPWM operation: default value of operation mode[7] of Vout Register 2 = 1 (表 8-3).

5 Pin Configuration and Functions

图 5-1. 8-Pin DSBGA YCH Package (Top View)

表 5-1. Pin Functions, TPS628610, TPS628600, TPS628603, TPS628604, TPS628605, and TPS628606

PIN		TYPE	DESCRIPTION
NAME	NO.		
GND	D2	PWR	GND supply pin. Connect this pin close to the GND terminal of the input and output capacitor.
VOS	D1	IN	Output voltage sense pin for the internal feedback divider network and regulation loop. This pin also discharges V_{OUT} by an internal MOSFET when the converter is disabled. Connect this pin directly to the output capacitor with a short trace.
VIN	C2	PWR	V_{IN} power supply pin. Connect the input capacitor close to this pin for best noise and voltage spike suppression. A ceramic capacitor is required.
SW	C1	PWR	The switch pin is connected to the internal MOSFET switches. Connect the inductor to this terminal.
VSEL	B2	IN	Voltage selection pin. Can be toggled during operation. LOW = 0.6 V (TPS628600, TPS628610), 1.05 V (TPS628603), HIGH = 1.1 V (TPS628600, TPS628610), 0.65 V (TPS628603)
EN	B1	IN	A high level enables the devices and a low level turns the device off. The pin features an internal pulldown resistor, which is disabled after the device has started up.
SDA	A2	IN	I ² C serial data pin. Do not leave floating.
SCL	A1	IN	I ² C serial clock pin. Do not leave floating.

表 5-2. Pin Functions, TPS628601

PIN		TYPE	DESCRIPTION
NAME	NO.		
GND	D2	PWR	GND supply pin. Connect this pin close to the GND terminal of the input and output capacitor.
VOS	D1	IN	Output voltage sense pin for the internal feedback divider network and regulation loop. This pin also discharges V_{OUT} by an internal MOSFET when the converter is disabled. Connect this pin directly to the output capacitor with a short trace.
VIN	C2	PWR	V_{IN} power supply pin. Connect the input capacitor close to this pin for best noise and voltage spike suppression. A ceramic capacitor is required.
SW	C1	PWR	The switch pin is connected to the internal MOSFET switches. Connect the inductor to this terminal.
PG	B2	OUT	Open-drain power-good output
EN	B1	IN	A high level enables the devices and a low level turns the device off. The pin features an internal pulldown resistor, which is disabled after the device has started up.
VSEL-1	A2	IN	Voltage Selection Pin. Can be toggled during operation.
VSEL-2	A1	IN	Voltage Selection Pin. Can be toggled during operation.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Pin voltage	VIN	- 0.3	6	V
Pin voltage	SW, DC	- 0.3	VIN +0.3V	V
Pin voltage	SW, transient < 10 ns, while switching	- 2.5	9	V
Pin voltage	EN, VSEL, SDA, SCL, PG	- 0.3	6	V
Pin voltage	VOS	- 0.3	5	V
TJ	Operating junction temperature	- 40	150	°C
Tstg	Storage temperature	- 55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating junction temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
VIN	Input supply voltage range		1.75		5.5	V
VOU	Output voltage range		0.4		1.9875	V
	Pin voltage	SW	0		5.5	V

7 Detailed Description

7.1 Overview

The TPS6286x is a high-frequency synchronous step-down converter with ultra-low quiescent current consumption and flexible output voltage by I²C or VSEL interface. Using TI's DCS-Control topology, the device extends the high efficiency operation area down to microamperes of load current during Power Save Mode Operation. TI's DCS-Control (direct control with seamless transition into power save mode) is an advanced regulation topology, which combines the advantages of hysteretic and voltage mode control. Characteristics of DCS-Control are excellent AC load regulation and transient response, low output ripple voltage, and a seamless transition between PFM and PWM mode operation. DCS-Control includes an AC loop which senses the output voltage (VOS pin) and directly feeds the information to a fast comparator stage. This comparator sets the switching frequency, which is constant for steady state operating conditions, and provides immediate response to dynamic load changes. To achieve accurate DC load regulation, a voltage feedback loop is used. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Soft Start

After the device has been enabled with EN high, it initializes and powers up the internal circuits. This occurs during the regulator start-up delay time, t_{Delay} . After t_{Delay} expires, the internal soft-start circuitry ramps up the output voltage within the soft-start time, t_{Ramp} . See [图 7-1](#).

图 7-1. Start-up Sequence

7.3.2 Output Voltage Selection (VSEL) for TPS62860x

The optional VSEL Interface allows setting the output voltage by a 2-pin HIGH/LOW setting. Using and applying a digital pattern to the "VSEL-1" and "VSEL-2" pins sets the output voltage according to [表 7-1](#).

表 7-1. Target Output Voltage Setting by VSEL Interface

VSEL-2	VSEL-1	TPS628601	TPS628602	OPERATION MODE
0	0	0.6 V	1.05 V	PFM Mode
0	1	0.7 V	0.9 V	PFM Mode
1	0	0.8 V	0.875 V	PFM Mode
1	1	1.0 V	0.625 V	PFM Mode

7.3.3 Output Voltage Selection (VSEL and I²C)

The TPS6286x has two options to select the output voltage.

The voltage on the VSEL pin can change the output voltage. Putting this pin HIGH selects the output voltage according to V_{OUT} register 2. Putting this pin LOW selects the voltage according to V_{OUT} Register 1. The pin can be toggled during operation.

The pin can also be selected by the value in the V_{OUT} register that is chosen by VSEL at the moment. The voltage changes right after the I²C command is received.

7.3.4 Undervoltage Lockout (UVLO)

To avoid misoperation of the device at low input voltages, an undervoltage lockout (UVLO) comparator monitors the supply voltage. The UVLO comparator shuts down the device at an input voltage of 1.7 V (maximum) with falling V_{IN} . The device starts at an input voltage of 1.8 V (maximum) rising V_{IN} . After the device re-enters operation out of an undervoltage lockout condition, the device behaves like being enabled.

7.3.5 Power Good (PG)

The built-in power-good (PG) signal indicates that the output voltage has reached the target and the device is ready. The PG signal can be used for start-up sequencing of multiple rails or to indicate any overload behavior on the output. The PG pin is an open-drain output that requires a pullup resistor to any voltage up to the recommended input voltage level. PG is low when the device is turned off due to EN or thermal shutdown. V_{IN}

must remain present for the PG pin to stay LOW. When applying V_{IN} the first time, PG stays HIGH until the first enabling of the device.

If the power-good output is not used, TI recommends to tie to GND or leave open.

表 7-2. Power Good Indicator Functional Table

LOGIC SIGNALS					PG STATUS
V_I	EN-PIN	THERMAL SHUTDOWN	V_{OUT}	DVS TRANSITION ACTIVE	
$V_I > UVLO$	HIGH	NO	V_{OUT} on target	NO	High Impedance
			$V_{OUT} < target$	YES	LOW
		YES	x	x	LOW
	LOW	x	x	x	LOW
$V_I < UVLO$	x	x	x	x	Undefined

The PG indicator triggers immediately (after internal comparator delay) when V_O crosses the lower V_{PGTH} to indicate that the voltage has left the target setting. It features a delay after crossing the upper V_{PGTH} when going high to make sure V_O has reached the target again. 图 7-2 sketches the behavior.

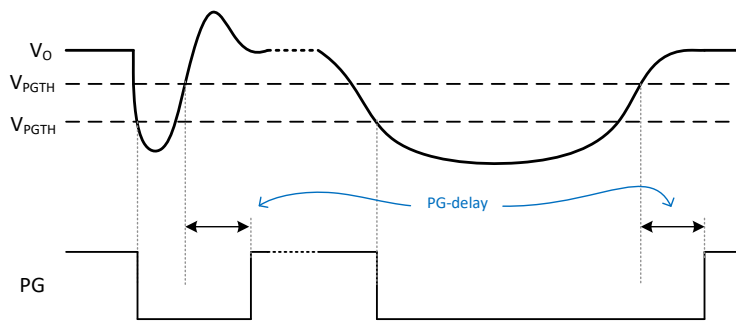

图 7-2. Power Good Transient and De-glitch Behavior

The PG Indicator is by default pulled low during DVS transition of the output voltage without any blanking or delay time. 图 7-2 shows an example of this behavior. After V_O has reached the new target, the PG is again active as shown in 图 7-2.

7.3.6 Switch Current Limit and Short Circuit Protection

The TPS6286x integrates a current limit on the high-side and low-side MOSFETs to protect the converter against overload or short-circuit conditions. The current in the switches is monitored cycle by cycle. If the high-side MOSFET current limit, I_{LIMF} , trips, the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp down the inductor current. After the inductor current through the low-side switch decreases below the low-side MOSFET current limit, I_{LIMF} , the low-side MOSFET is turned off and the high-side MOSFET turns on again.

7.3.7 Thermal Shutdown

The junction temperature (T_J) of the device is monitored by an internal temperature sensor. If T_J exceeds the thermal shutdown temperature TSD of 160°C (typ), the device enters thermal shutdown. Both the high-side and low-side power FETs are turned off. When T_J decreases below the hysteresis amount of typically 20°C, the converter resumes operation, beginning with a soft start to the originally set V_{OUT} . The thermal shutdown is not active in Power Save Mode.

7.3.8 Output Voltage Discharge

The purpose of the output discharge function is to make sure a defined down-ramp of the output voltage when the device is disabled and to keep the output voltage close to 0 V. The output discharge feature is only active

after the device has been enabled at least once since the supply voltage was applied. The output discharge function is not active if the device is disabled and the supply voltage is applied the first time. The internal discharge resistor is connected to the VOS pin. The discharge function is enabled as soon as the device is disabled. The minimum supply voltage required to keep the discharge function active is $V_I > V_{TH_UVLO}$.

7.4 Device Functional Modes

7.4.1 Smart Enable and Shutdown (EN)

An internal 500-k Ω resistor pulls the EN pin to GND and avoids the pin to be floating. This prevents an uncontrolled start-up of the device in case the EN pin cannot be driven to low level safely. With EN low, the device is in shutdown mode. The device is turned on with EN set to a high level. The pulldown control circuit disconnects the pulldown resistor on the EN pin after the internal control logic and the reference have been powered up. With EN set to a low level, the device enters shutdown mode and the pulldown resistor is activated again.

7.4.2 Forced PWM Operation

Through I²C, set the device in forced PWM (FPWM) mode by the CONTROL register. The device switches continuously, even with a light load. This reduces the output voltage ripple and allows simple filtering of the switching frequency for noise-sensitive applications. Efficiency at light load is lower in FPWM mode.

7.4.3 Forced PWM Mode During Output Voltage Change

In normal operation, the device does not force PWM operation during VOUT change after VSEL toggle or I²C command. For ramping down, this mode provides the remaining energy, stored in the output capacitor to the load of the DC/DC and save battery charge. See [图 9-14](#).

Through I²C, the device can be set to forced PWM (FPWM) switching during output voltage change. This allows a controlled ramp of V_{OUT} up and especially down, regardless of the load condition. See [图 9-15](#).

This feature follows the internal I²C ramp and is only recommended for the setting 1 mV/ μ s and 0.1 mV/ μ s. During the faster slopes (10 mV/ μ s and 5 mV/ μ s), the mode is likely to be left before the voltage reached the new target value.

7.4.4 Power Save Mode

As the load current decreases, the device enters Power Save Mode (PSM) operation. PSM occurs when the inductor current becomes discontinuous, which is when the inductor current reaches 0 A during a switching cycle. In power save mode, the output voltage rises slightly above the nominal output voltage. This effect is minimized by increasing the output capacitor or inductor value.

7.5 Programming

7.5.1 Serial Interface Description

I²C™ is a 2-wire serial interface developed by Philips Semiconductor, now NXP Semiconductors (see I²C-Bus Specification, Version .6, 2014). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is *idle*, both SDA and SCL lines are pulled high. All the I²C-compatible devices connect to the I²C bus through open-drain I/O pins, SDA and SCL. A *controller* device, usually a microcontroller or a digital signal processor, controls the bus. The controller is responsible for generating the SCL signal and device addresses. The controller also generates specific conditions that indicate the START and STOP of data transfer. A *target* device receives, transmits data, or both on the bus under control of the controller device.

The TPS6286x device works as a *target* and supports the following data transfer *modes*, as defined in the I²C-Bus Specification: standard mode (100 kbps), fast mode (400 kbps), and fast mode plus (1 Mbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as the input voltage remains above 1.8 V.

The data transfer protocol for standard and fast modes is exactly the same, therefore, the modes are referred to as F/S-mode in this document. The protocol for high-speed mode is different and must not be used.

TI recommends that the I²C controller initiates a STOP condition on the I²C bus after the initial power up of SDA and SCL pullup voltages to make sure of reset of the I²C engine.

7.5.2 Standard- and Fast-Mode Protocol

The controller initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in 图 7-3. All I²C-compatible devices recognize a start condition.

图 7-3. START and STOP Conditions

The controller then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the controller makes sure that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see 图 7-4). All devices recognize the address sent by the controller and compare to the internal fixed addresses. Only the target device with a matching address generates an acknowledge (see 图 7-5) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the controller knows that communication link with a target has been established.

图 7-4. Bit Transfer on the Serial Interface

The controller generates further SCL cycles to either transmit data to the target (R/W bit 1) or receive data from the target (R/W bit 0). In either case, the receiver must acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the controller or by the target, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see 图 7-3). This action releases the bus and stops the communication link with the addressed target. All I²C-compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and the devices wait for a start condition followed by a matching address.

Attempting to read data from register addresses not listed in this section results in 00h being read out.

图 7-5. Acknowledge on the I²C Bus

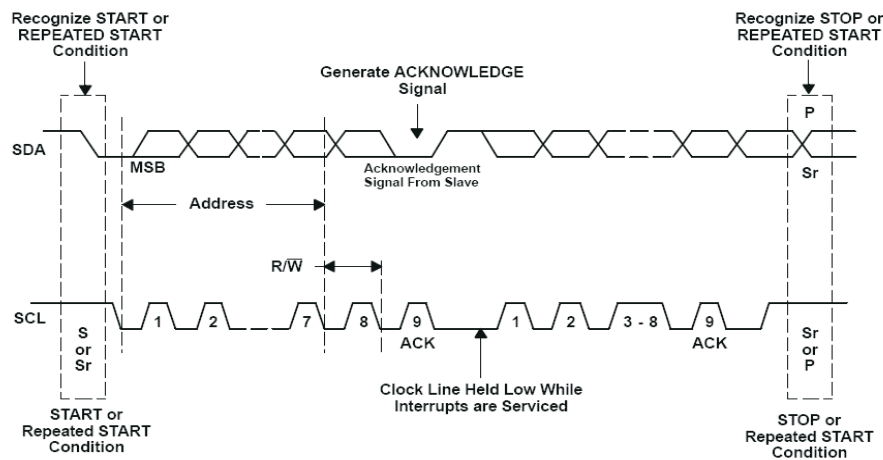

图 7-6. Bus Protocol

7.5.3 I²C Update Sequence

The requires the following:

- A start condition
- A valid I²C address
- A register address byte
- A data byte for a single update

After the receipt of each byte, the device acknowledges by pulling the SDA line low during the high period of a single clock pulse. A valid I²C address selects the device. The device performs an update on the falling edge of the acknowledge signal that follows the LSB byte.

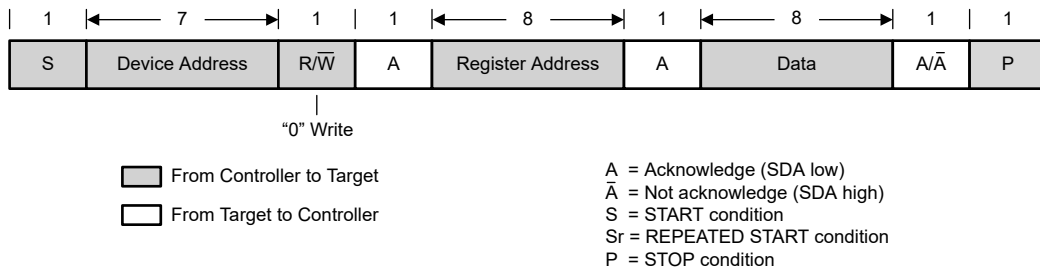

图 7-7. “Write” Data Transfer Format in Standard-, Fast, and Fast-Plus Modes

图 7-8. “Read” Data Transfer Format in Standard-, Fast, and Fast-Plus Modes

7.5.4 I²C Register Reset

The I²C registers can be reset by the following:

- Pull the input voltage below 1.8 V (typ).
- A high to low transition on EN. The previous value of the "Enable Output Discharge" bit is latched until the next EN rising edge or pulling the input voltage below 1.0 V (typ).
- Set the Reset bit in the CONTROL register. When Reset is set to 1, all registers are reset to the default values and a new start-up begins immediately. After t_{Delay} , the I²C registers can be programmed again.

8 Register Map

表 8-1. Register Map

REGISTER ADDRESS (HEX)	REGISTER NAME	FACTORY DEFAULT (HEX)	DESCRIPTION
0x01	V _{OUT} Register 1	0x10	Sets the target output voltage
0x02	V _{OUT} Register 2	0x38	Sets the target output voltage
0x03	CONTROL Register		Sets miscellaneous configuration bits
0x05	STATUS Register	0x00	Returns status flags, cleared on read-out

8.1 I2C Address Byte

7	6	5	4	3	2	1	0
1	x	x	x	x	x	x	R/W

The target I2C address byte is the first byte received following the START condition from the controller device. The 7-bit target I2C address is internally set and has the value according the Device Comparison Table in 节 4 .

8.2 Register Address Byte

7	6	5	4	3	2	1	0
0	0	0	0	0	D2	D1	D0

Following the successful acknowledgment of the target I2C address, the bus controller sends a byte to the device, which contains the address of the register to be accessed.

8.3 V_{OUT} Register 1

表 8-2. V_{OUT} Register 1 Description (Output Voltage Range 0.4 V to 1.9875 V)

REGISTER ADDRESS 0X01 READ/WRITE			
BIT	FIELD	VALUE (HEX)	OUTPUT VOLTAGE (TYP)
6:0	VO1_SET	0x00	0.400V
		0x01	0.4125V
		...	
		0x10	0.600V (default value for TPS628600/TPS628610)
		0x24	0.85V (default value for TPS628604)
		0x31	1.0125V (default value for TPS628606)
		...	
		0x34	1.05V (default value for TPS628603)
		...	
		0x70	1.8V (default value for TPS628605)
		0x7E	1.975V
		0x7F	1.9875 V

8.4 V_{OUT} Register 2

表 8-3. V_{OUT} Register 2 Description (Output Voltage Range 0.4 V to 1.9875 V)

REGISTER ADDRESS 0X02 READ/WRITE			
BIT	FIELD	VALUE (HEX)	DESCRIPTION
7	Operation Mode	0x0	Keep PFM/PWM selection as in CONTROL-Register
		0x1	Sets the device in PWM operation for this Voltage selection (default value for TPS628605 and TPS628606)
BIT	FIELD	VALUE (HEX)	OUTPUT VOLTAGE (TYP)
6:0	VO2_SET	0x00	0.400V
		0x01	0.4125V
		...	
		0x14	0.65V (default value for TPS628603)
		...	
		0x31	1.0125V (default value for TPS628606)
		0x38	1.10V (default value for TPS628600/04 and TPS628610)
		...	
		0x70	1.8V (default value for TPS628605)
		0x7E	1.975V
0x7F	1.9875V		

8.5 CONTROL Register

表 8-4. CONTROL Register Description

REGISTER ADDRESS 0X03 READ/WRITE				
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7	Reset	W	0	1 - Reset all registers to default. This bit triggers a shutdown followed by a re-reading of the internal OTP settings and a new soft start.
6	Enable FPWM Mode during Output Voltage Change	R/W	1	0 - Keep the current mode status during output voltage change. 1 - Force the device in FPWM during output voltage change.
5	Software Enable Device	R/W	1	0 - Disable the device. All registers values are still kept. 1 - Re-enable the device with a new start-up without the t _{Delay} period.
4	Enable FPWM Mode	R/W	0	0 - Set the device in power save mode at light loads. 1 - Set the device in forced PWM mode at light loads.
3	Enable Output Discharge	R/W	1	0 - Disable output discharge. 1 - Enable output discharge. This setting is used for the next disable cycle (Software or Hardware).
2	Reserved			
0:1	Voltage Ramp Speed	R/W	11 ⁽¹⁾	00 - 10mV/μs 01 - 5 mV/μs 10 - 1 mV/μs 11 - 0.1 mV/μs

(1) The default value is programmed with 00 for TPS628603

8.6 STATUS Register

表 8-5. STATUS Register Description

REGISTER ADDRESS 0X05 READ ONLY ⁽¹⁾				
BIT	FIELD	TYPE	DEFAULT	DESCRIPTION
7:5	Reserved			
4	Thermal Shutdown Tripped	R	0	1: Thermal Shutdown has tripped since the last reading. 0: No Thermal Shutdown event occurred during the last reading.
3	Reserved			
2	Power Bad	R	0	1: Output voltage is or was below 0.95xVO 0: No Power Bad event occurred since last reading
1:0	Reserved			

- (1) All bit values are latched until the device is reset, or the STATUS register is read. Then, the STATUS register is reset to the default values.

9 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

9.2 Typical Application, TPS628610

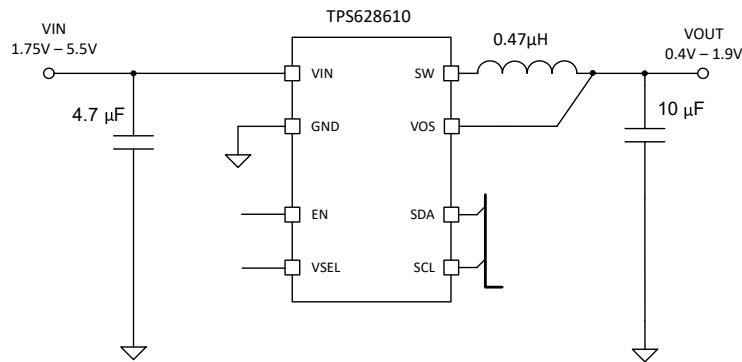

图 9-1. TPS628610, Typical Application

9.2.1 Design Requirements

表 9-1 shows the list of components for the application circuit and the characteristic application curves.

表 9-1. Components for Application Characteristic Curves

REFERENCE	DESCRIPTION	VALUE	SIZE [L x W X T]	MANUFACTURER ⁽¹⁾
TPS628610	Step down converter, 1 A		1.4 mm × 0.70 mm × 0.4 mm maximum	Texas Instruments

(1) See [Third-party Products Disclaimer](#).

9.2.2 Detailed Design Procedure

9.2.2.1 Inductor Selection

The inductor value affects the peak-to-peak ripple current, the PWM-to-PFM transition point, the output voltage ripple, and the efficiency. The selected inductor has to be rated for the DC resistance and saturation current. The inductor ripple current (ΔI_L) decreases with higher inductance and increases with higher V_{IN} or V_{OUT} and can be estimated according to [方程式 1](#).

[方程式 2](#) calculates the maximum inductor current under static load conditions. The saturation current of the inductor must be rated higher than the maximum inductor current, as calculated with [方程式 2](#). TI recommends this rating because during a heavy load transient the inductor current rises above the calculated value. A more conservative way is to select the inductor saturation current according to the high side MOSFET switch current limit, I_{LIMF} .

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (1)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2} \quad (2)$$

where

- f = Switching frequency
- L = Inductor value
- ΔI_L = Peak-to-peak inductor ripple current
- I_{Lmax} = Maximum inductor current

[表 9-2](#) shows a list of possible inductors.

表 9-2. List of Possible Inductors

INDUCTANCE [μ H]	INDUCTOR SERIES	SIZE IMPERIAL (METRIC)	DIMENSIONS L x W x T	SUPPLIER ⁽¹⁾
0.47	DFE18SAN_G0	0603 (1608)	1.6 mm x 0.8 mm x 1.0 mm maximum	Murata
0.47	HTEB16080F	0603 (1608)	1.6 mm x 0.8 mm x 0.6 mm maximum	Cyntec
0.47	HTET1005FE	0402 (1005)	1.0 mm x 0.5 mm x 0.65 mm maximum	Cyntec
0.47	TFM160808ALC	0603 (1608)	1.6 mm x 0.8 mm x 0.8 mm maximum	TDK

(1) See [Third-party Products Disclaimer](#)

9.2.2.2 Output Capacitor Selection

The DCS-Control scheme of the TPS6286x allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric. At light-load currents, the converter operates in power save mode and the output voltage ripple is dependent on the output capacitor value. A larger output capacitors can be used reducing the output voltage ripple.

The inductor and output capacitor together provide a low-pass filter. [表 9-3](#) outlines possible inductor and capacitor value combinations to simplify this process.

表 9-3. Recommended LC Output Filter Combinations

DEVICE	NOMINAL INDUCTOR VALUE (μH)	NOMINAL OUTPUT CAPACITOR VALUE (μF)			
		4.7 μF	10 μF	2 \times 10 μF	22 μF
	0.47 ⁽¹⁾	✓	✓ ⁽³⁾	✓	✓
TPS62860x	1.0 ⁽²⁾	✓	✓ ⁽³⁾	✓	✓

(1) TI recommends an effective inductance range of 0.33 μH to 0.82 μH . TI recommends an effective capacitance range of 2 μF to 26 μF .

(2) TI recommends an effective inductance range of 0.7 μH to 1.2 μH . TI recommends an effective capacitance range of 3 μF to 26 μF .

(3) Typical application configuration. Other check marks indicate alternative filter combinations.

9.2.2.3 Input Capacitor Selection

Because the buck converter has a pulsating input current, a low ESR ceramic input capacitor is required for best input voltage filtering to minimize input voltage spikes. For most applications, a 4.7- μF input capacitor is sufficient. When operating from a high-impedance source (such as a coin cell), TI recommends a larger input buffer capacitor ≥ 10 μF to avoid voltage drops during start-up and load transients. The input capacitance can be increased without any limit for better input voltage filtering. The leakage current of the input capacitor adds to the overall current consumption.

表 9-4 shows a selection of input and output capacitors.

表 9-4. Capacitor Options

CAPACITANCE [μF]	CAPACITOR PART NUMBER	SIZE IMPERIAL (METRIC)	DIMENSIONS L \times W \times T	SUPPLIER ⁽¹⁾
4.7	GRM155R60J475ME47D	0402 (1005)	1.0 mm \times 0.5 mm \times 0.6 mm maximum	Murata
4.7	GRM035R60J475ME15	0201 (0603)	0.6 mm \times 0.3 mm \times 0.55 mm maximum	Murata

See [节 9.2.2](#).

9.3.3 Application Curves

9.4 Power Supply Recommendations

The power supply must provide a current rating according to the supply voltage, output voltage, and output current of the TPS6286x.

9.5 Layout

9.5.1 Layout Guidelines

The pinout of the TPS6286x converter has been optimized to enable a single top layer PCB routing of the converter and the critical passive components such as C_{IN} , C_{OUT} , and L . This pinout allows the connection of tiny components such as 0201 (0603) size capacitors and 0402 (1005) size inductor. A design size smaller than 5 mm^2 can be achieved with a fixed output voltage.

- As for all switching power supplies, the layout is an important step in the design. A specified performance requires the correct on board layout.
- Provide a low inductance, low impedance ground path. Therefore, use wide and short traces for the main current paths.
- Place the input capacitor as close as possible to the V_{IN} and GND pins of the converter. This is the most critical component placement.
- The V_{OS} line is a sensitive, high impedance line and must be connected to the output capacitor and routed away from noisy components and traces (for example, SW line) or other noise sources.

9.5.2 Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 (www.ti.com/lit/snva009).

EXAMPLE STENCIL DESIGN

YCH0008

DSBGA - 0.4 mm max height

DIE SIZE BALL GRID ARRAY

SOLDER PASTE EXAMPLE
BASED ON 0.075 mm THICK STENCIL
SCALE: 50X

4225328/B 06/2023

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
